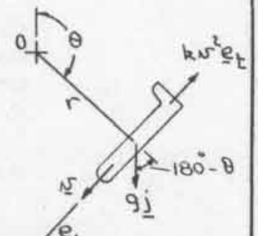
FIND: $v_{MAX}$ AND THE FIRST TWO VALUES OF $\theta$ FOR WHICH $v = 0$ FOR EACH COMBINATION OF $\theta_0$ AND $k$

ANALYSIS



IN THE TANGENTIAL DIRECTION, THE TANGENTIAL COMPONENT OF THE ACCELERATION OF THE AIRPLANE IS

$$a_t = g\sin(180° - \theta) - kv^2$$
$$= g\sin\theta - kv^2$$

RECALLING THAT $a_t = \frac{dv}{dt}$

HAVE $\frac{dv}{dt} = g\sin\theta - kv^2$

NOW, SINCE $r =$ CONSTANT, HAVE $v = r\dot{\theta}$

THEREFORE, THE DIFFERENTIAL EQUATIONS

$$\frac{dv}{dt} = g\sin\theta - kv^2$$

$$\frac{d\theta}{dt} = \frac{1}{r}v$$

DEFINE THE MOTION OF THE AIRPLANE.

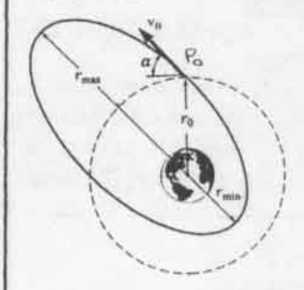
*13.117

GIVEN:

FROM PROB. 13.107

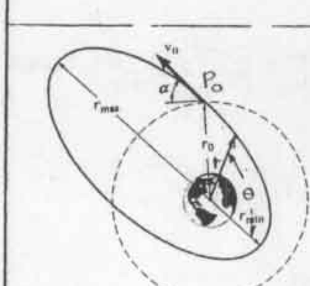
$r_{min} = r_0(1-\sin\alpha)$

$r_{max} = r_0(1+\sin\alpha)$



SHOW THAT:

INTENDED CIRCULAR ORBIT AND RESULTING ELLIPTIC ORBIT INTERSECT AT THE ENDS OF THE MINOR AXIS OF THE ELLIPTIC ORBIT AT $P_0$



IF THE POINT OF INTERSECTION $P_0$ OF THE CIRCULAR AND ELLIPTIC ORBITS IS AT AN END OF THE MINOR AXIS, THEN $v_0$ IS PARALLEL TO THE MAJOR AXIS. THIS WILL BE THE CASE ONLY IF $\alpha + 90° = \theta_0$, THAT IS IF $\cos\theta_0 = -\sin\alpha$

WE MUST THEREFORE PROVE THAT

$$\cos\theta_0 = -\sin\alpha \quad (1)$$

WE RECALL FROM EQ (12.39):

$$\frac{1}{r} = \frac{GM}{h^2} + C\cos\theta \quad (2)$$

WHEN $\theta = 0$, $r = r_{min}$ AND $r_{min} = r_0(1-\sin\alpha)$

$$\frac{1}{r_0(1-\sin\alpha)} = \frac{GM}{h^2} + C \quad (3)$$

FOR $\theta = 180°$, $r = r_{max} = r_0(1+\sin\alpha)$

$$\frac{1}{r_0(1+\sin\alpha)} = \frac{GM}{h^2} - C \quad (4)$$

ADDING (3) AND (4) AND DIVIDING BY 2:

$$\frac{GM}{h^2} = \frac{1}{2r_0}\left(\frac{1}{1-\sin\alpha} + \frac{1}{1+\sin\alpha}\right) = \frac{1}{r_0\cos^2\alpha}$$

SUBTRACTING (4) FROM (3) AND DIVIDING BY 2:

$$C = \frac{1}{2r_0}\left(\frac{1}{1-\sin\alpha} - \frac{1}{1+\sin\alpha}\right) = \frac{1}{2r_0}\frac{2\sin\alpha}{1-\sin^2\alpha}$$

$$C = \frac{\sin\alpha}{r_0\cos^2\alpha}$$

SUBSTITUTE FOR $\frac{GM}{h^2}$ AND C INTO EQ (2)

$$\frac{1}{r} = \frac{1}{r_0\cos^2\alpha}(1+\sin\alpha\cos\theta) \quad (5)$$

LETTING $r = r_0$ AND $\theta = \theta_0$ IN EQ (5), WE HAVE

$$\cos^2\alpha = 1 + \sin\alpha\cos\theta_0$$

$$\cos\theta_0 = \frac{\cos^2\alpha - 1}{\sin\alpha} = -\frac{\sin^2\alpha}{\sin\alpha} = -\sin\alpha$$

THIS PROVES THE VALIDITY OF EQ (1) AND THUS $P_0$ IS AN END OF THE MINOR AXIS OF THE ELLIPTIC ORBIT

GIVEN:
16-Mg PLANE MAINTAINS $v = 774\ \text{km/h}$ WITH $\alpha = 18°$. IT SCOOPS AIR AT RATE OF 300 kg/s AND DISCHARGES IT AT 665 m/s RELATIVE TO PLANE.

FIND: (a) INITIAL ACCELERATION IF PILOT CHANGES TO HORIZONTAL FLIGHT WITH SAME ENGINE SETTING
(b) MAX. HORIZONTAL SPEED THAT WILL BE ATTAINED.
(ASSUME THAT DRAG IS PROPORTIONAL TO $v^2$.)

DETERMINATION OF THRUST

SINCE AIRPLANE IS ACCELERATED IN HORIZONTAL FLIGHT, WE USE A REFERENCE FRAME AT REST WITH RESPECT TO THE ATMOSPHERE WHEN USING EQ. (14.39) TO DETERMINE THE THRUST $\underline{F}$ (CF. FOOTNOTE, PAGE 860).

$$F = \frac{dm}{dt}(v_B - v_A)$$

WHERE $v_A = 0$, $v_B = v_{DISCH.} - v_{PLANE}$

$$= 665\ \text{m/s} - 774\ \text{km/h}\left(\frac{1000\ \text{m}}{3600\ \text{s}}\right)$$

$$= 665\ \text{m/s} - 215\ \text{m/s} = 450\ \text{m/s}$$

$$F = (300\ \text{kg/s})(450\ \text{m/s} - 0) = 135.0\ \text{kN}$$

AIRPLANE CLIMBING (NO ACCELERATION)

$\Sigma F_{\angle 18°} = 0$

$135.0\ \text{kN} - D - W\sin 18° = 0$

$D = 135.0\ \text{kN} - (16\ \text{Mg})(9.81\ \text{m/s}^2)\sin 18°$

$= 135.0\ \text{kN} - 48.50\ \text{kN} = 86.50\ \text{kN}$

(a) AT START OF HORIZONTAL FLIGHT

THRUST AND DRAG ARE STILL THE SAME

$\Sigma F = ma \qquad F - D = ma$

$$(135.0 - 86.5)\times 10^3\ \text{N} = (16\times 10^3\ \text{kg})a$$

$$a = 3.03\ \text{m/s}^2$$

(b) AT MAX. SPEED IN HORIZONTAL FLIGHT

WE HAVE $a = 0$

$F_m - D_m = 0 \qquad (1)$

WHERE

$F_m = \frac{dm}{dt}(u - v_m) = (300\ \text{kg/s})(665\ \text{m/s} - v_m) \qquad (2)$

ON THE OTHER HAND

$D_m = k v_m^2 \qquad (3)$

BUT, INITIALLY, WE HAD $D = 86.50\ \text{kN}$ AND $v = 774\ \text{km/h} = 215\ \text{m/s}$ AND, THEREFORE

$D = kv^2$

$86.50\times 10^3\ \text{N} = k(215\ \text{m/s})^2 \qquad (4)$

DIVIDING (3) AND (4) MEMBER BY MEMBER:

$\frac{D_m}{86.50\times 10^3} = \frac{v_m^2}{(215)^2} \qquad D_m = 1.8713\, v_m^2 \qquad (5)$

SUBSTITUTING FOR $F_m$ FROM (2) AND FOR $D_m$ FROM (5) INTO (1):

$$300(665 - v_m) - 1.8713\, v_m^2 = 0$$

$$v_m^2 + 160.32\, v_m - 106.61\times 10^3 = 0$$

$$v_m = \frac{-160.32 + \sqrt{(160.32)^2 + 4(106.61\times 10^3)}}{2} = 256.05\ \text{m/s}$$

$$= (256.05\ \text{m/s})\frac{3600\ \text{s}}{1000\ \text{m}} = 921.78\ \text{km/h}$$

$v_m = 922\ \text{km/h}$

OR: OUTPUT POWER $= A\rho v_A(v_AV - V^2)(1-\cos\theta)$

(a) FOR MAX. POWER: $d(\text{POWER})/dV = 0$:

$A\rho v_A(v_A - 2V)(1-\cos\theta) = 0 \qquad V = \frac{1}{2}v_A$

(b) MAX. POWER: MAKE $V = \frac{1}{2}v_A$ IN EQ. (1):

MAX. POWER $= A\rho v_A(v_A - \frac{1}{2}v_A)(1-\cos\theta)\frac{1}{2}v_A = \frac{1}{4}A\rho(1-\cos\theta)v_A^3$

(c) EFFICIENCY

$$\text{INPUT POWER} = \frac{1}{2}\frac{\Delta m}{\Delta t}v_A^2 = \frac{1}{2}(\rho Q)v_A^2 = \frac{1}{2}(\rho A v_A)v_A^2 = \frac{1}{2}A\rho v_A^3 \qquad (2)$$

DIVIDE (1) BY (2):

$$\eta = \frac{\text{OUTPUT POWER}}{\text{INPUT POWER}} = \frac{A\rho v_A(v_A - V)(1-\cos\theta)V}{\frac{1}{2}A\rho v_A^3}$$

$$\eta = 2\frac{V}{v_A}\left(1 - \frac{V}{v_A}\right)(1-\cos\theta)$$

NOTE: MAXIMUM EFFICIENCY IS OBTAINED WHEN $V = \frac{1}{2}v_A$ AND $\theta = 180°$:

$\eta_{MAX} = 2(\frac{1}{2})(\frac{1}{2})(2) = 1$

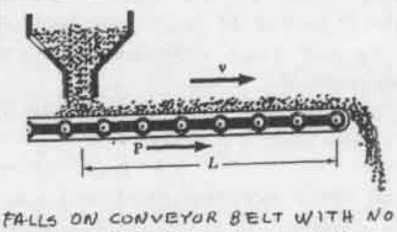
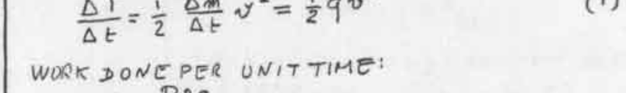
## 14.85



GIVEN:
GRAVEL FALLS ON CONVEYOR BELT WITH NO VELOCITY AND AT THE CONSTANT RATE $q = dm/dt$

(a) FIND MAGNITUDE OF FORCE $\underline{P}$ REQUIRED TO MAINTAIN A CONSTANT BELT SPEED.
(b) SHOW THAT K.E. REQUIRED BY GRAVEL IN GIVEN TIME INTERVAL IS HALF THE WORK DONE BY $\underline{P}$. WHAT HAPPENS TO THE OTHER HALF OF WORK OF $\underline{P}$?

(a) WE APPLY THE IMPULSE-MOMENTUM PRINCIPLE TO THE GRAVEL ON THE BELT AND TO THE MASS $\Delta m$ OF GRAVEL HITTING AND LEAVING BELT IN INTERVAL $\Delta t$.

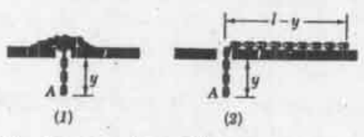


$\xrightarrow{+}$ x COMP.: $mv + P\Delta t = mv + (\Delta m)v$
$$P = \frac{\Delta m}{\Delta t} v = qv \qquad P = qv$$

(b) KINETIC ENERGY ACQUIRED PER UNIT TIME:
$$\frac{\Delta T}{\Delta t} = \frac{1}{2}\frac{\Delta m}{\Delta t} v^2 = \frac{1}{2} q v^2 \qquad (1)$$
WORK DONE PER UNIT TIME:
$$\frac{\Delta U}{\Delta t} = \frac{P\Delta x}{\Delta t} = Pv$$
RECALLING THE RESULT OF PART a:
$$\frac{\Delta U}{\Delta t} = (qv)v = qv^2 \qquad (2)$$
COMPARING EQS. (1) AND (2), WE CONCLUDE THAT
$$\frac{\Delta T}{\Delta t} = \frac{1}{2}\frac{\Delta U}{\Delta t} \qquad (Q.E.D.)$$

THE OTHER HALF OF THE WORK OF $\underline{P}$ IS DISSIPATED INTO HEAT BY FRICTION AS THE GRAVEL SLIPS ON THE BELT BEFORE REACHING THE SPEED $v$.

## 14.86



GIVEN: CHAIN OF LENGTH $l$ AND MASS $m$ FALLS THROUGH SMALL HOLE IN PLATE. CHAIN IS AT REST WHEN $y$ IS VERY SMALL.

FIND IN EACH CASE SHOWN:

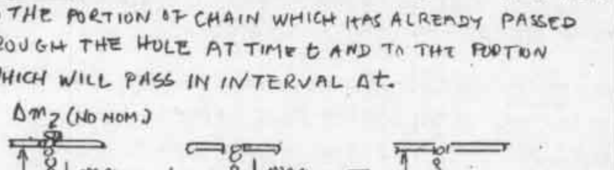
(a) ACCELERATION OF FIRST LINK A AS FUNCTION OF $y$.

(b) VELOCITY OF CHAIN AS LAST LINK PASSES THRU HOLE.

IN CASE 1, ASSUME THAT EACH LINK IS AT REST UNTIL IT FALLS THRU HOLE

IN CASE 2, ASSUME THAT ALL LINKS HAVE THE SAME SPEED AT ANY GIVEN INSTANT.

CASE 1. WE APPLY THE IMPULSE-MOMENTUM PRINCIPLE TO THE PORTION OF CHAIN WHICH HAS ALREADY PASSED TROUGH THE HOLE AT TIME $t$ AND TO THE PORTION WHICH WILL PASS IN INTERVAL $\Delta t$.



$$+\downarrow \frac{my}{l}v + \frac{mgy}{l}\Delta t = \frac{m}{l}(\cancel{yv} + y\Delta v + v\Delta y + \Delta y\Delta v)$$

DIVIDE BY $\Delta t$ AND LET $\Delta t \to 0$: $gy = y\frac{dv}{dt} + v\frac{dy}{dt} = \frac{d}{dt}(yv)$

MULTIPLY BOTH SIDES BY $yv\,dt$ AND NOTE THAT $v\,dt = dy$:

$$gy^2dy = yv\,d(yv)$$

SET $yv = u$ AND INTEGRATE:

$$\int_0^y gy^2dy = \int_0^{yv} u\,du$$

$$\frac{1}{3}gy^3 = \frac{1}{2}(yv)^2 \qquad v^2 = \frac{2}{3}gy \qquad (1)$$

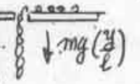
(a) DIFFERENTIATE (1) WITH RESPECT TO $t$:

$$2v\frac{dv}{dt} = \frac{2}{3}g\frac{dy}{dt} \quad \text{OR} \quad 2va = \frac{2}{3}gv$$

$$a = \frac{1}{3}g$$

(b) AS LAST LINK PASSES THROUGH HOLE, $y = l$ AND EQ (1) YIELDS $v^2 = \frac{2}{3}gl$ $\qquad v = \sqrt{\frac{2}{3}gl}$

CASE 2. (a) AT TIME $t$, THE FORCE CAUSING THE ACCELERATION OF THE ENTIRE CHAIN IS THE WEIGHT OF THE LENGTH $y$ OF CHAIN WHICH HAS PASSED THROUGH:



$$\Sigma F = ma:$$

$$mg\left(\frac{y}{l}\right) = ma \qquad a = \frac{gy}{l}$$

(b) SETTING $a = v\frac{dv}{dy}$, WE HAVE

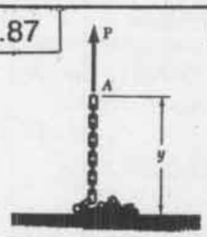
$$v\,dv = \frac{g}{l}y\,dy$$

INTEGRATING IN $v$ FROM 0 TO $v$ AND IN $y$ FROM 0 TO $l$:

$$\frac{1}{2}v^2 = \frac{1}{2}\frac{g}{l}\frac{l^2}{2}$$

$$v = \sqrt{gl}$$

## 14.87



GIVEN:

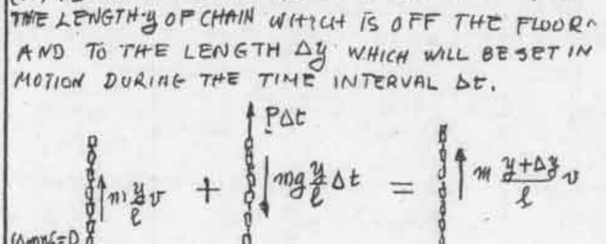
CHAIN OF LENGTH $l$ AND MASS $m$ IS LYING IN A PILE ON FLOOR. IT IS RAISED AT A CONSTANT $v$.

FIND FOR ANY $y$:

(a) MAGNITUDE OF FORCE $P$,

(b) REACTION OF FLOOR.

(a) WE APPLY THE IMPULSE-MOMENTUM PRINCIPLE TO THE LENGTH $y$ OF CHAIN WHICH IS OFF THE FLOOR AND TO THE LENGTH $\Delta y$ WHICH WILL BE SET IN MOTION DURING THE TIME INTERVAL $\Delta t$.



$$+\uparrow y \text{ COMP.: } m\frac{y}{l}v + P\Delta t - mg\frac{y}{l}\Delta t = m\cdot\frac{y+\Delta y}{l}v$$

$$P\Delta t = \frac{m}{l}(gy\Delta t - \cancel{yv} + \cancel{yv} + v\Delta y)$$

DIVIDING BY $\Delta t$:

$$P = \frac{m}{l}\left(gy + v\frac{\Delta y}{\Delta t}\right)$$

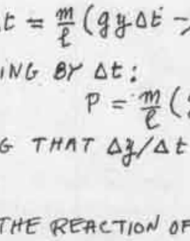
NOTING THAT $\Delta y/\Delta t = v$,

$$P = \frac{m}{l}(gy + v^2)$$

(b) THE REACTION OF THE FLOOR IS EQUAL TO THE WEIGHT OF CHAIN STILL ON THE FLOOR:

$$R = mg - mg\frac{y}{l} \qquad R = mg\left(1 - \frac{y}{l}\right)$$

## 14.88



GIVEN:

CHAIN OF LENGTH $l$ AND MASS $m$ IS LOWERED INTO A PILE ON THE FLOOR AT CONSTANT $v$

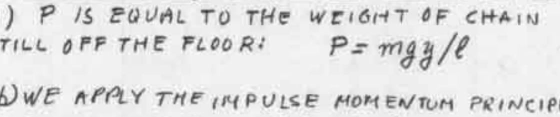
FIND FOR ANY $y$:

(a) MAGNITUDE OF FORCE $P$.

(b) REACTION OF THE FLOOR.

(a) $P$ IS EQUAL TO THE WEIGHT OF CHAIN STILL OFF THE FLOOR: $\qquad P = mgy/l$

(b) WE APPLY THE IMPULSE MOMENTUM PRINCIPLE TO THE LENGTH $l-y$ OF CHAIN ON THE FLOOR AND TO THE LENGTH $\Delta y$ WHICH HITS THE FLOOR IN $\Delta t$:



$$+\uparrow y \text{ COMP.: } -m\frac{\Delta y}{l}v - \frac{mg}{l}(l-y+\Delta y)\Delta t + R\Delta t = 0$$

SOLVING FOR $R$:

$$R = \frac{m}{l}\left[g(l-y+\Delta y) + v\frac{\Delta y}{\Delta t}\right]$$

BUT $\frac{\Delta y}{\Delta t} = v$ AND $\Delta y \to 0$ WHEN $\Delta t \to 0$.

THEREFORE: $\qquad R = \frac{m}{l}\left[g(l-y) + v^2\right]$

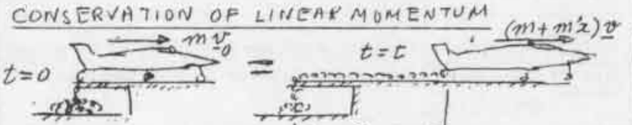
CONSERVATION OF LINEAR MOMENTUM



$\xrightarrow{+}$ $x$ COMR: $\quad m v_0 = (m + m'x) v \qquad (1)$

(a) WE WANT $v = \beta v_0$ FOR $x = \ell$. SUBSTITUTE:

$$m v_0 = (m + m'\ell)\beta v_0$$
$$m v_0 (1-\beta) = m'\ell\beta v_0$$

MASS OF CHAIN $= m'\ell = \dfrac{1-\beta}{\beta} m \qquad (2)$

(b) SOLVE EQ. (1) FOR $v$:

$$v = \frac{m v_0}{(m + m'x)} \qquad (3)$$

$$a = \frac{dv}{dt} = -\frac{m v_0}{(m+m'x)^2} m' \frac{dx}{dt} = -\frac{m m' v_0 v}{(m+m'x)^2}$$

OR, RECALLING (3): $\quad a = -\dfrac{m^2 m' v_0^2}{(m+m'x)^3} \qquad (4)$

DECELERATION IS MAXIMUM FOR $x = 0$. WE HAVE

$$(-a)_{max} = \frac{m^2 m' v_0^2}{m^3} = \frac{m'}{m} v_0^2 \qquad (5)$$

WRITING $|F|_{max} = m|a|_{max}$ AND RECALLING (2):

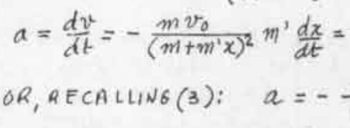
## 14.90



GIVEN:
AS 6000-kg PLANE LANDS AT 180 km/h ON CARRIER, ITS TAIL HOOKS INTO END OF 80-m-LONG CHAIN OF MASS OF 50 kg/m.

FIND: (a) MAX. DECELERATION OF PLANE, (b) VELOCITY WHEN ENTIRE CHAIN IS PULLED OUT.

SEE SOLUTION OF PROB. 14.89 FOR DERIVATION OF EQS. (3) AND (5).

(a) FROM EQ. (5):

$$\text{MAX. DECEL.} = (-a)_{max} = \frac{m'}{m} v_0^2 = \frac{50\text{ kg/m}}{6000\text{ kg}} \left(\frac{180}{3.6}\text{ m/s}\right)^2$$

MAX. DECEL. = 20.8 m/s²

(b) FROM EQ. (3), FOR $x = \ell = 80$ m:

$$v_{max} = \frac{m v_0}{(m + m'\ell)} = \frac{(6000\text{ kg})(180\text{ km/h})}{6000\text{ kg} + (50\text{ kg/m})(80\text{ m})}$$

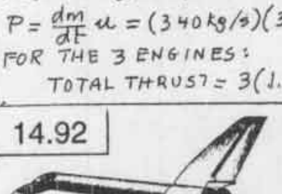
$$P = \frac{dm}{dt} u = (340\text{ kg/s})(3750\text{ m/s}) = 1.275 \times 10^6\text{ N}$$

FOR THE 3 ENGINES:

TOTAL THRUST $= 3(1.275 \times 10^6\text{ N}) = 3.83$ MN

## 14.92



GIVEN:
THE THREE ENGINES OF SPACE SHUTTLE PROVIDE A TOTAL THRUST OF 6 MN. PROPELLANT IS EJECTED WITH A RELATIVE VEL. OF 3750 m/s.

FIND: RATE AT WHICH PROPELLANT IS BURNED BY EACH OF THE THREE ENGINES.

THRUST OF EACH ENGINE: $P = \frac{1}{3}(6\text{ MN}) = 2 \times 10^6$ N

EQ. (14.44): $P = \dfrac{dm}{dt} u$

$2 \times 10^6\text{ N} = \dfrac{dm}{dt}(3750\text{ m/s}) \qquad \dfrac{dm}{dt} = \dfrac{2 \times 10^6\text{ N}}{3750\text{ m/s}} = 533\text{ kg/s}$

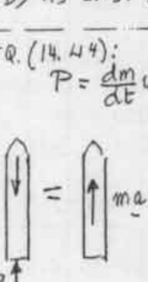
## 14.93

GIVEN:
ROCKET FIRED VERTICALLY FROM GROUND
WEIGHT OF ROCKET (INCLUDING FUEL) = 2400 lb
WEIGHT OF FUEL = 2000 lb
FUEL EJECTED AT RATE OF 25 lb/s WITH RELATIVE VELOCITY OF 12,000 ft/s.

FIND: ACCELERATION OF ROCKET
(a) AS IT IS FIRED,
(b) AS LAST PARTICLE OF FUEL IS BEING CONSUMED

EQ. (14.44):

$$P = \frac{dm}{dt} u = \frac{25\text{ lb/s}}{g}(12{,}000\text{ ft/s}) = \frac{300 \times 10^3}{g}$$



$+\uparrow \Sigma \underline{F} = m\underline{a}$:

$$a = \frac{300 \times 10^3}{W} - g \qquad (1)$$

(a) AS ROCKET IS FIRED:

$W = 2400$ lb

FROM (1): $\quad a = \dfrac{300 \times 10^3}{2400} - 32.2 = 125.0 - 32.2 = 92.8$

$\underline{a} = 92.8$ ft/s² ↑

(b) AS LAST PARTICLE OF FUEL IS BEING CONSUMED:

$W = 2400 - 2000 = 400$ lb

FROM (1): $\quad a = \dfrac{300 \times 10^3}{400} - 32.2 = 750 - 32.2 = 717.8$

$\underline{a} = 718$ ft/s² ↑

GIVEN:
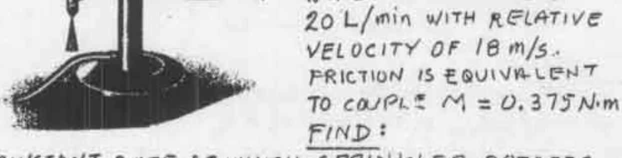
EACH OF THE FOUR ROTATING ARMS OF SPRINKLER CONSISTS OF TWO STRAIGHT PORTIONS OF PIPE FORMING 120° ANGLE. EACH ARM DISCHARGES WATER AT THE RATE OF 20 L/min WITH RELATIVE VELOCITY OF 18 m/s. FRICTION IS EQUIVALENT TO COUPLE $M = 0.375$ N·m.

FIND:
CONSTANT RATE AT WHICH SPRINKLER ROTATES.

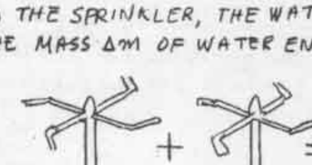
WE APPLY THE IMPULSE-MOMENTUM PRINCIPLE TO THE SPRINKLER, THE WATER IT CONTAINS, AND THE MASS $\Delta m$ OF WATER ENTERING IN INTERVAL $\Delta t$.



EQUATING MOMENTS ABOUT AXIS OF ROTATION:

$$0 + M\Delta t = 4\left[\text{MOMENT OF } \left(\tfrac{\Delta m}{4}\right) v\right]$$

$$M\Delta t = \text{MOMENT OF } (\Delta m)\, v \qquad (1)$$



THE VELOCITY $v$ OF THE WATER LEAVING AN ARM IS THE RESULTANT OF THE VELOCITY $v'$ RELATIVE TO THE ARM AND OF THE VELOCITY $v_A$ OF NOZZLE

$$v = v' + v_A$$

WHERE $v' = 18$ m/s AND $v_A = (OA)\omega$

BUT APPLYING THE LAW OF COSINES TO TRIANGLE OAB:

$$(OA)^2 = (OB)^2 + (BA)^2 - 2(OB)(BA)\cos 120°$$
$$= (0.15\,m)^2 + (0.10\,m)^2 - 2(0.15\,m)(0.10\,m)\cos 120°$$
$$(OA)^2 = 0.0475\ m^2$$

THEREFORE:

+ MOM. OF $v$ ABOUT O = MOM. OF $v'$ + MOM. OF $v_A$

$$= (0.15\,m)\, v' \cos 30° - (OA)(OA)\,\omega$$
$$= (0.15\,m)(18\ m/s)\cos 30° - (OA)^2\omega$$
$$= 2.3383\ m^2/s - (0.0475\ m^2)\,\omega$$

SUBSTITUTING INTO EQ.(1) AND RECALLING THAT $M = 0.375$ N·m:

$$(0.375\ N\cdot m)\Delta t = (\Delta m)\left[2.3383\ m^2/s - (0.0475\ m^2)\omega\right]$$

## 14.C6

GIVEN:

ROCKET OF WEIGHT 2400 lb, INCLUDING 2000 lb OF FUEL, IS FIRED VERTICALLY FROM GROUND. IT CONSUMES FUEL AT RATE OF 25 lb/s AND EJECTS IT WITH RELATIVE VELOCITY OF 12,000 ft/s.

FIND FROM TIME OF IGNITION TO TIME WHEN LAST PARTICLE OF FUEL IS CONSUMED, AND AT 4-S TIME INTERVALS:

(a) ACCELERATION $a$ OF ROCKET IN ft/s²,

(b) ITS VELOCITY $v$ IN ft/s,

(c) ITS ELEVATION $h$ ABOVE GROUND IN MILES.

ANALYSIS

WE RECALL FROM SAMPLE PROB. 14.8 THAT

$$v = u \ln \frac{m_0}{m_0 - qt} - gt \qquad (1)$$

WHERE $v$ = VELOCITY OF ROCKET

$m_0$ = INITIAL WEIGHT OF ROCKET AND FUEL

$q$ = RATE AT WHICH FUEL IS CONSUMED

$u$ = RELATIVE VELOCITY AT WHICH FUEL IS EJECTED

LETTING $v = dy/dt$ AND INTEGRATING $y$ FROM 0 TO $h$:

$$h = \int_0^h dy = u \int_0^t \ln \frac{m_0}{m_0 - qt}\, dt - \frac{1}{2} g t^2 \qquad (2)$$

TO CALCULATE THE INTEGRAL, WE SET $\dfrac{m_0 - qt}{m_0} = z$

AND OBTAIN $dt = -\dfrac{m_0}{q} dz$. THEREFORE:

$$\int_0^t \ln \frac{m_0}{m_0 - qt}\, dt = \int_1^z (-\ln z)\left(-\frac{m_0}{q} dz\right)$$

$$= \frac{m_0}{q}\int_1^z \ln z\, dz = \frac{m_0}{q}\left[z \ln z - z\right]_1^z = \frac{m_0}{q}(z \ln z - z + 1)$$

THUS, EQ. (2) YIELDS

$$h = \frac{m_0 u}{q}\left(\frac{m_0 - qt}{m_0} \ln \frac{m_0 - qt}{m_0} - 1 + \frac{qt}{m_0} + 1\right) - \frac{1}{2} g t^2$$

$$h = u\left(t + \frac{m_0 - qt}{q} \ln \frac{m_0 - qt}{m_0}\right) - \frac{1}{2} g t^2 \qquad (3)$$

REWRITING EQ. (1) AS

$$v = u \ln m_0 - u \ln(m_0 - qt) - gt$$

AND DIFFERENTIATING WITH RESPECT TO $t$,

$$a = \frac{dv}{dt} = -u \frac{-q}{m_0 - qt} - g \qquad a = \frac{uq}{m_0 - qt} - g \qquad (4)$$

COMPUTE FINAL TIME $= t_f = m_f/q = 2000/25 = 80$ s

FOR $t$ FROM 0 TO 80 s AT 4-s INTERVALS, COMPUTE

(a) ACCELERATION $a$ FROM EQ. (4)

(b) VELOCITY $v$ FROM EQ. (1)

(c) ELEVATION $h$ FROM EQ. (3), DIVIDING RESULT BY 5280 TO OBTAIN $h$ IN MILES.

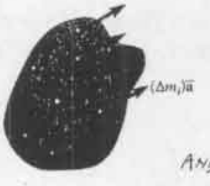
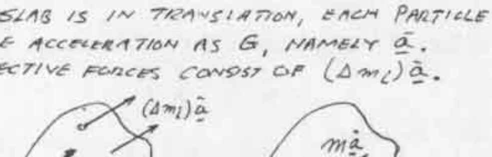
## 16.23



FOR TRANSLATION SHOW THAT EFFECTIVE FORCES ARE $(\Delta m)\bar{a}$ ATTACHED TO PARTICLES AND ARE REDUCE TO $m\bar{a}$ ATTACHED AT $G$

SINCE SLAB IS IN TRANSLATION, EACH PARTICLE HAS SAME ACCELERATION AS $G$, NAMELY $\bar{\underline{a}}$. THE EFFECTIVE FORCES CONSIST OF $(\Delta m_i)\bar{\underline{a}}$.



THE SUM OF THESE VECTORS IS: $\Sigma(\Delta m_i)\bar{\underline{a}} = (\Sigma\Delta m_i)\bar{\underline{a}}$

OR SINCE $\Sigma\Delta m_i = m$,

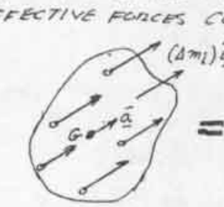
$$\Sigma(\Delta m_i)\bar{\underline{a}} = m\bar{\underline{a}}$$

THE SUM OF THE MOMENTS ABOUT $G$ IS:

$$\Sigma\, \underline{r}_i' \times (\Delta m_i)\bar{\underline{a}} = (\Sigma\,\Delta m_i \underline{r}_i')\times\bar{\underline{a}} \qquad (1)$$

BUT, $\Sigma\,\Delta m_i \underline{r}_i' = m\bar{\underline{r}}' = 0$, BECAUSE $G$ IS THE MASS CENTER. IT FOLLOWS THAT THE RIGHT-HAND MEMBER OF EQ.(1) IS ZERO. THUS, THE MOMENT ABOUT $G$ OF $m\bar{\underline{a}}$ MUST ALSO BE ZERO, WHICH MEANS THAT ITS LINE OF ACTION PASSES THROUGH $G$ AND THAT IT MAY BE ATTACHED AT $G$.

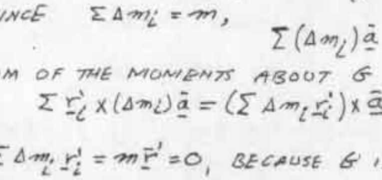
## 16.24



FOR CENTROIDAL ROTATION, SHOW THAT EFFECTIVE FORCES CONSIST OF VECTORS $-(\Delta m_i)\omega^2\underline{r}_i'$ AND $(\Delta m_i)(\underline{\alpha}\times\underline{r}_i')$ ATTACHED TO PARTICLES AND REDUCE TO A COUPLE $\bar{I}\underline{\alpha}$.

FOR CENTROIDAL ROTATION: $\underline{a}_i = (\underline{a}_i)_t + (\underline{a}_i)_n = \underline{\alpha}\times\underline{r}_i' - \omega^2\underline{r}_i'$

EFFECTIVE FORCES ARE: $(\Delta m_i)\underline{a}_i = (\Delta m_i)(\underline{\alpha}\times\underline{r}_i') - (\Delta m_i)\,\omega^2\underline{r}_i'$



$$\Sigma(\Delta m_i)\underline{a}_i = \Sigma(\Delta m_i)(\underline{\alpha}\times\underline{r}_i') - \Sigma(\Delta m_i)\omega^2 r_i'$$
$$= \alpha\times\Sigma(\Delta m_i)\underline{r}_i' - \omega^2\Sigma(\Delta m_i)\underline{r}_i'$$

SINCE $G$ IS THE MASS CENTER, $\Sigma(\Delta m_i)r_i' = 0$

∴ EFFECTIVE FORCES REDUCE TO A COUPLE.

SUMMING MOMENTS ABOUT $G$

$$\Sigma(\underline{r}_i'\times\Delta m_i\underline{a}_i) = \Sigma\left[\underline{r}_i'\times(\Delta m_i)(\underline{\alpha}\times\underline{r}_i')\right] - \Sigma\,\underline{r}_i'\times(\Delta m_i)\omega^2 r_i'$$

BUT, $\underline{r}_i'\times(\Delta m_i)\omega^2\underline{r}_i' = \omega^2(\Delta m_i)(\underline{r}_i'\times\underline{r}_i') = 0$

AND, $\underline{r}_i'\times(\Delta m_i)(\underline{\alpha}\times\underline{r}_i') = (\Delta m_i)r_i'^2\alpha$

THUS, $\Sigma(\underline{r}_i'\times\Delta m_i\underline{a}_i) = \Sigma(\Delta m_i)r_i'^2\underline{\alpha} = \left[\Sigma(\Delta m_i)r_i'^2\right]\alpha$

SINCE $\Sigma(\Delta m)r_i'^2 = \bar{I}$,

THE MOMENT OF THE COUPLE IS $\bar{I}\underline{\alpha}$

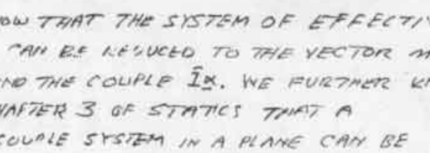
## 16.46

SHOW THAT SYSTEM OF EFFECTIVE FORCES FOR A SLAB REDUCES TO $m\bar{a}$ AND EXPRESS DISTANCE FROM ITS LINE OF ACTION TO G IN TERMS OF $\bar{k}$, $\bar{a}$, AND $\alpha$.

---

WE KNOW THAT THE SYSTEM OF EFFECTIVE FORCES CAN BE REDUCED TO THE VECTOR $m\bar{a}$ AT G AND THE COUPLE $\bar{I}\alpha$. WE FURTHER KNOW FROM CHAPTER 3 OF STATICS THAT A FORCE-COUPLE SYSTEM IN A PLANE CAN BE FURTHER REDUCED TO A SINGLE FORCE.

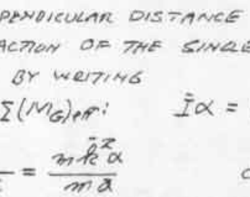


THE PERPENDICULAR DISTANCE $d$ FROM G TO THE LINE OF ACTION OF THE SINGLE VECTOR $m\bar{a}$ IS EXPRESSED BY WRITING

$+\circlearrowleft \Sigma M_G = \Sigma (M_G)_{eff}: \qquad \bar{I}\alpha = (m\bar{a})d$

$$d = \frac{\bar{I}\alpha}{m\bar{a}} = \frac{m\bar{k}^2\alpha}{m\bar{a}} \qquad d = \frac{\bar{k}^2\alpha}{\bar{a}}$$

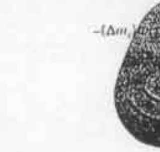
## 16.47



SHOW THAT THE SYSTEM OF EFFECTIVE FORCES OF A RIGID SLAB CONSISTS OF THE VECTORS SHOWN ATTACHED TO THE PARTICLES $P_i$ OF THE SLAB. FURTHER SHOW THAT THE EFFECTIVE FORCES REDUCE TO $m\bar{a}$ ATTACHED AT G AND A COUPLE $\bar{I}\alpha$.

---

KINEMATICS



THE ACCELERATION OF $P_i$ IS

$$a_i = \bar{a} + a_{P_i/G}$$

$$a_i = \bar{a} + \alpha \times r_i' + \omega \times (\omega \times r_i')$$

$$= \bar{a} + \alpha \times r_i' - \omega^2 r_i'$$

NOTE THAT $\alpha \times r_i'$ IS $\perp$ TO $r_i'$

THUS, THE EFFECTIVE FORCES ARE AS SHOWN IN FIG P16.47 (also shown above). WE WRITE

$$(\Delta m_i)a_i = (\Delta m_i)\bar{a} + (\Delta m_i)(\alpha \times r_i') - (\Delta m_i)\,\omega^2 r_i'$$

THE SUM OF THE EFFECTIVE FORCES IS

$$\Sigma(\Delta m_i)a_i = \Sigma(\Delta m_i)\bar{a} + \Sigma(\Delta m_i)(\alpha \times r_i') - \Sigma(\Delta m_i)\,\omega^2 r_i'$$

$$\Sigma(\Delta m_i)a_i = \bar{a}\,\Sigma(\Delta m_i) + \alpha \times \Sigma(\Delta m_i)r_i' - \omega^2\,\Sigma(\Delta m_i)r_i'$$

(CONTINUED)

## 16.47 continued

WE NOTE THAT $\Sigma(\Delta m_i) = m$. AND SINCE G IS THE MASS CENTER

$$\Sigma(\Delta m_i)r_i' = m\bar{r}_i' = 0$$

THUS, $\Sigma(\Delta m_i)\,a_i = m\bar{a}$ (1)

THE SUM OF THE MOMENTS ABOUT G OF THE EFFECTIVE FORCES IS:

$$\Sigma(r_i' \times \Delta m_i a_i) = \Sigma r_i' \times \Delta m_i \bar{a} + \Sigma r_i' \times (\Delta m_i)(\alpha \times r_i') - \Sigma r_i' \times (\Delta m_i)\,\omega^2 r_i'$$

$$\Sigma(r_i' \times \Delta m_i a_i) = (\Sigma r_i' \Delta m_i)\bar{a} + \Sigma\left[r_i' \times (\alpha \times r_i')\Delta m_i\right] - \omega^2\,\Sigma(r_i' \times r_i')\Delta m_i$$

SINCE G IS THE MASS CENTER, $\Sigma r_i' \Delta m_i = 0$

ALSO, FOR EACH PARTICLE, $r_i' \times r_i' = 0$

THUS

$$\Sigma(r_i' \times \Delta m_i a_i) = \Sigma\left[r_i' \times (\alpha_i \times r_i')\,\Delta m_i\right]$$

SINCE $\alpha \perp r_i'$, WE HAVE $r_i' \times (\alpha \times r_i') = r_i^2\alpha$ AND

$$\Sigma(r_i' \times \Delta m_i a_i) = \Sigma r_i'^2(\Delta m_i)\alpha = (\Sigma r_i'^2 \Delta m_i)\alpha$$

SINCE $\Sigma r_i'^2 \Delta m_i = \bar{I}$

$$\Sigma(r_i' \times \Delta m_i a_i) = \bar{I}\alpha \qquad (2)$$

FROM EQS. (1) AND (2) WE CONCLUDE THAT SYSTEM OF EFFECTIVE FORCES REDUCE TO $m\bar{a}$ ATTACHED AT G AND A COUPLE $\bar{I}\alpha$.

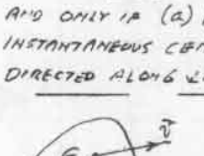
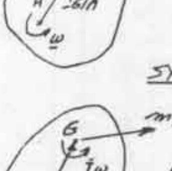
FOR A RIGID SLAB IN PLANE MOTION, SHOW THAT $\underline{H}_A$ IS EQUAL TO $I_A\omega$, IF AND ONLY IF (a) A IS THE MASS CENTER, (b) A IS THE INSTANTANEOUS CENTER OF ROTATION, (c) $\underline{v}_A$ IS DIRECTED ALONG LINE AG.



FOR GENERAL PLANE MOTION

$\underline{\bar{v}} = \underline{v}_A + \underline{v}_{G/A} = \underline{v}_A + \underline{\omega}\times \underline{r}_{G/A}$

SYSTEM OF MOMENTA



MOMENTS ABOUT A

$\underline{H}_A = \bar{I}\underline{\omega} + \underline{r}_{G/A}\times m\underline{\bar{v}}$

$\underline{H}_A = \bar{I}\underline{\omega} + m\,\underline{r}_{G/A}\times(\underline{v}_A + \underline{\omega}\times \underline{r}_{G/A})$

$\underline{H}_A = \bar{I}\underline{\omega} + m\,\underline{r}_{G/A}\times \underline{v}_A + m\,\underline{r}_{G/A}\times(\underline{\omega}\times \underline{r}_{G/A})$

SINCE $\underline{\omega} \perp \underline{r}_{G/A}$ THE TRIPLE VECTOR PRODUCT CAN BE WRITTEN: $\underline{r}_{G/A}\times(\underline{\omega}\times \underline{r}_{G/A}) = r_{G/A}^2\,\underline{\omega}$

THUS $\underline{H}_A = \bar{I}\underline{\omega} + m\,\underline{r}_{G/A}\times \underline{v}_A + m\,r_{G/A}^2\,\underline{\omega}$

BY PARALLEL-AXIS THEOREM: $I_A = \bar{I} + m\,r_{G/A}^2$

WE NOW HAVE $\underline{H}_A = I_A\,\omega + m\,\underline{r}_{G/A}\times \underline{v}_A$

$\therefore\ \underline{H}_A = I_A\,\omega$, ONLY WHEN $\underline{r}_{G/A}\times \underline{v}_A = 0$

(a) $r_{G/A} = 0$: A COINCIDES WITH G

(b) $v_A = 0$: A IS INSTANT. CENTER

## 18.13

(*a*) Show that the angular momentum $\mathbf{H}_B$ of a rigid body about point $B$ can be obtained by adding to the angular momentum $\mathbf{H}_A$ of that body about point $A$ the vector product of the vector $\mathbf{r}_{A/B}$ drawn from $B$ to $A$ and the linear momentum $m\bar{\mathbf{v}}$ of the body:

$$\mathbf{H}_B = \mathbf{H}_A + \mathbf{r}_{A/B} \times m\bar{\mathbf{v}}$$

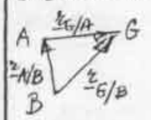
(*b*) Further show that when a rigid body rotates about a fixed axis, its angular momentum is the same about any two points $A$ and $B$ located on the fixed axis ($\mathbf{H}_A = \mathbf{H}_B$) if, and only if, the mass center $G$ of the body is located on the fixed axis.

(a) USING EQ. (18.11) TO DETERMINE $\underline{H}_A$ AND THEN $\underline{H}_B$:

$$\underline{H}_A = \underline{r}_{G/A} \times m\underline{\bar{v}} + \underline{H}_G \quad (1)$$

$$\underline{H}_B = \underline{r}_{G/B} \times m\underline{\bar{v}} + \underline{H}_G \quad (2)$$

SUBTRACTING (1) FROM (2):



$$\underline{H}_B - \underline{H}_A = (\underline{r}_{G/B} - \underline{r}_{G/A}) \times m\underline{\bar{v}}$$

BUT $\underline{r}_{G/B} = \underline{r}_{A/B} + \underline{r}_{G/A}$

THUS: $\underline{H}_B = \underline{H}_A + \underline{r}_{A/B} \times m\underline{\bar{v}}$ (3)

(Q.E.D.)

(b) IT FOLLOWS FROM EQ. (3) THAT $\underline{H}_A = \underline{H}_B$ IF, AND ONLY IF,

$$\underline{r}_{A/B} \times m\underline{\bar{v}} = 0 \quad (4)$$

BUT, DENOTING BY $\underline{\lambda}_{A/B}$ THE UNIT VECTOR ALONG THE FIXED AXIS, WE HAVE $\underline{\bar{v}} = \omega \underline{\lambda}_{A/B} \times \underline{r}_{G/A}$; EQ (4) YIELDS

$$\underline{r}_{A/B} \times m(\omega \underline{\lambda}_{A/B} \times \underline{r}_{G/A}) \quad (5)$$

WE NOTE THAT $\underline{r}_{A/B}$ IS PERPENDICULAR TO $\omega\underline{\lambda}_{A/B} \times \underline{r}_{G/A}$ AND, THUS, NOT PARALLEL TO IT. THEREFORE, THIS SECOND VECTOR MUST BE ZERO, WHICH WILL OCCUR IF $\underline{r}_{G/A}$ IS PARALLEL TO $\underline{\lambda}_{AB}$, THAT IS, IF, AND ONLY IF, G IS LOCATED ON AB.

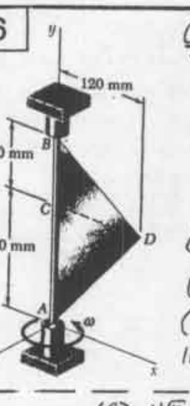
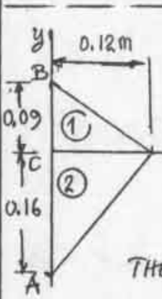
## 18.16



GIVEN:
TRIANGULAR PLATE SHOWN HAS MASS $m = 7.5$ kg AND IS WELDED TO SHAFT AB. PLATE ROTATES AT CONSTANT RATE $\omega = 12$ rad/s.

FIND:
(a) ANG. MOMENTUM $\underline{H}_C$
(b) ANG. MOMENTUM $\underline{H}_A$
(FIND $\bar{\underline{v}}$ AND USE PROPERTY INDICATED IN PROB. 18.13a.)



(a) WE DIVIDE PLATE INTO TWO RIGHT TRIANGLES AND COMPUTE THEIR PRODUCTS OF INERTIA.

$m_1 = \frac{9}{25}(7.5\text{ kg}) = 2.7$ kg

$m_2 = \frac{16}{25}(7.5\text{ kg}) = 4.8$ kg

FROM SAMPLE PROB. 9.6, WE RECALL THAT $I_{xy,\,AREA} = \frac{1}{24} b^2 h^2$

THEREFORE $I_{xy,\,MASS} = \frac{m}{\frac{1}{2}bh}\left(\frac{1}{24} b^2 h^2\right) = \frac{mbh}{12}$

TRIANGLE 1: $(I_{x'y})_1 = \frac{1}{12}(2.7\text{ kg})(0.12\text{ m})(0.09\text{ m}) = 2.43\times10^{-3}$ kg·m²

TRIANGLE 2: $(I_{x'y})_2 = \frac{1}{12}(4.8\text{ kg})(0.12\text{ m})(-0.16\text{ m}) = -7.68\times10^{-3}$ kg·m²

THUS, FOR THE PLATE, $I_{x'y} = (2.43 - 7.68)10^{-3} = -5.25\times10^{-3}$ kg·m²

WE NOTE THAT $I_{yz'} = 0$. $\qquad I_{x'y} = -5.25$ g·m²

MOMENT OF INERTIA $\bar{I}_y$ OF ENTIRE PLATE:

$I_{y,\,AREA} = \frac{1}{12} b h^3, \quad I_{y,\,MASS} = \frac{m}{\frac{1}{2}bh}\left(\frac{1}{12}bh^3\right) = \frac{1}{6} m h^2$

$I_y = \frac{1}{6}(7.5\text{ kg})(0.12\text{ m})^2 = 0.018\text{ kg·m}^2 = 18\text{ g·m}^2$

ANGULAR MOMENTUM $\underline{H}_C$

WE USE EQS. (18.13) TO OBTAIN THE COMPONENTS $H_{x'}$, $H_y$, $H_{z'}$ OF $\underline{H}_C$

$H_{x'} = -I_{x'y}\,\omega = -(-5.25\text{ g·m}^2)(12\text{ rad/s}) = +63.0\text{ g·m}^2/\text{s}$

$H_y = I_y\,\omega = (18\text{ g·m}^2)(12\text{ rad/s}) = 216\text{ g·m}^2/\text{s}$

$H_{z'} = -I_{yz'}\,\omega = 0$

THEREFORE $\quad \underline{H}_C = (63.0\text{ g·m}^2/\text{s})\,\underline{i} + (216\text{ g·m}^2/\text{s})\,\underline{j}$ ◀

(b) ANGULAR MOMENTUM $\underline{H}_A$.

WE APPLY THE EQUATION GIVEN IN PART a OF PROB. 18.13 TO POINTS A AND C.

$$\underline{H}_A = \underline{H}_C + \underline{r}_{C/A} \times m\bar{\underline{v}} \qquad (1)$$

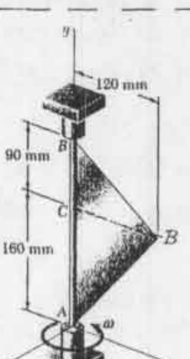
## 18.44

GIVEN: TRIANGULAR PLATE OF PROB. 18.16 OF MASS $m = 7.5$ kg WITH ANG. VEL. $\omega = 12$ rad/s

FIND: KINETIC ENERGY OF PLATE



SINCE $\omega_x = \omega_z = 0$, EQ. (18.19) REDUCES TO

$$T = \frac{1}{2}I_y\omega^2 \qquad (1)$$

BUT $I_{y,\text{AREA}} = \frac{1}{12}bh^3$

AND $I_{y,\text{MASS}} = \frac{m}{\frac{1}{2}bh}(\frac{1}{12}bh^3) = \frac{1}{6}mh^2$

WHERE $m = 7.5$ kg, $h = CB = (0.12\text{ m})$

THUS $I_{y,\text{MASS}} = \frac{1}{6}(7.5\text{ kg})(0.12\text{ m})^2$

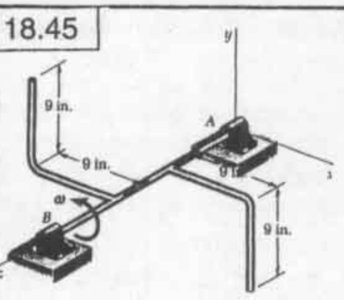
$= 18.00\times 10^{-3}\text{ kg·m}^2$

SUBSTITUTING THIS VALUE FOR $I_y$ AND 12 rad/s FOR $\omega$ INTO (1), WE HAVE

$T = \frac{1}{2}(18.00\times 10^{-3}\text{ kg·m}^2)(12\text{ rad/s})^2$

$T = 1.296$ J

## 18.45



GIVEN:
ASSEMBLY OF PROB. 18.19 WHICH ROTATES AT 360 rpm. EACH L-SHAPED ARM WEIGHS 5 lb.
FIND:
KINETIC ENERGY OF ASSEMBLY.

SINCE $\omega_x = \omega_y = 0$, EQ. (18.19) REDUCES TO

$$T = \frac{1}{2} I_z \omega^2$$

FOR ONE ARM (OF MASS $m$):

$$I_z = (\bar{I}_z)_1 + \frac{m}{2} d^2 + (\bar{I}_z)_2$$

$$= \frac{1}{12}\frac{m}{2}a^2 + \frac{m}{2}\left(a^2 + \frac{a^2}{4}\right) + \frac{1}{3}\frac{m}{2}a^2 = \frac{5}{6}ma^2$$

FOR BOTH ARMS: $I_z = \frac{5}{3}ma^2 = \frac{5}{3}\,\frac{5\text{ lb}}{32.2\text{ ft/s}^2}\left(\frac{3}{4}\text{ ft}\right)^2$

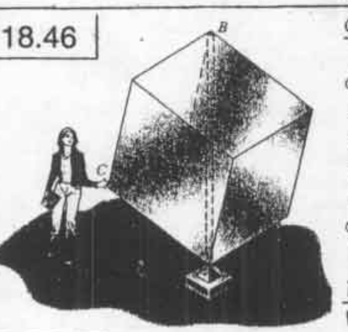
$$= 0.14557 \text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

AND $\omega = 360 \frac{\text{rev}}{\text{min}} = 360 \frac{2\pi \text{ rad}}{60 \text{ s}} = 12\pi$ rad/s

THUS: $T = \frac{1}{2}I_z\omega^2 = \frac{1}{2}(0.14557 \text{ lb}\cdot\text{ft}\cdot\text{s}^2)(12\pi \text{ rad/s})^2$

$$T = 103.5 \text{ ft}\cdot\text{lb}$$

## 18.46



GIVEN:
HOLLOW 5×5 ft ALUMINUM CUBE OF PROB. 18.21. STUDENT PUSHES CORNER C FOR 1.25 IN DIRECTION PERPENDICULAR TO PLANE ABC WITH 12.5-lb FORCE, CAUSING CUBE TO COMPLETE 1 REV IN 5 s.
FIND: KINETIC ENERGY IMPARTED TO CUBE.

DIRECT COMPUTATION OF K.E.

WE HAVE $\omega = (2\pi \text{ rad})/5\text{ s} = 1.2566$ rad/s

WE RECALL FROM PROB. 18.21 THAT AB IS A PRINCIPAL AXIS AND THAT $I_{AB} = \frac{5}{18}ma^2$. THUS, EQ. (18.19) YIELDS

$$T = \frac{1}{2}I_{AB}\omega^2 = \frac{1}{2}\frac{5}{18}ma^2\omega^2 = \frac{5}{36}m(5\text{ ft})^2(1.2566 \text{ rad/s})^2$$

BUT WE FOUND IN PROB. 18.21 THAT $W = 226$ lb

THUS: $T = \frac{5}{36}\,\frac{226\text{ lb}}{32.2\text{ ft/s}^2}(5\text{ ft})^2(1.2566\text{ rad/s})^2 = 38.48$ ft·lb

$$T = 38.5 \text{ ft}\cdot\text{lb}$$

ALTERNATIVE SOLUTION

WE NOTE THAT THE K.E. IMPARTED TO THE CUBE IS EQUAL TO THE WORK $U_{1\to2}$ DONE BY THE STUDENT:

$$T = U_{1\to2} = F\Delta s$$

WHERE $F = 12.5$ lb AND $\Delta s = \frac{1}{2}v\Delta t = \frac{1}{2}\omega r \Delta t$

RECALLING THAT THE RADIUS $r$ OF THE CIRCLE DESCRIBED BY C IS (SEE HINT IN PROB. 18.21)

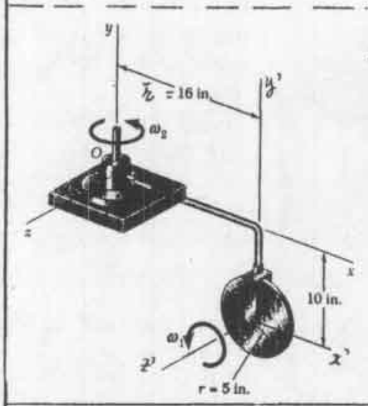
$$r = a\sqrt{2/3} = (5\text{ ft})\sqrt{2/3} = 4.0825 \text{ ft}$$

WE HAVE $\Delta s = \frac{1}{2}(1.2566\text{ rad/s})(4.0825\text{ ft})(1.2\text{ s}) = 3.078$ ft

AND $T = (12.5\text{ lb})(3.078\text{ ft}) = 38.48$ ft·lb, $T = 38.5$ ft·lb

## 18.47

GIVEN:
DISK OF PROB. 18.5 WITH WEIGHT $W = 8$ lb, AND ANGULAR VELOCITIES $\omega_1 = 12$ rad/s AND $\omega_2 = 4$ rad/s.
FIND: KINETIC ENERGY OF DISK.



EQ. (18.17):

$$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}(\bar{I}_{x'}\omega_{x'}^2 + \bar{I}_{y'}\omega_{y'}^2 + \bar{I}_{z'}\omega_{z'}^2)$$

$$= \frac{1}{2}m\omega_2^2\bar{r}^2 + \frac{1}{2}\left(0 + \frac{1}{4}mr^2\omega_2^2 + \frac{1}{2}mr^2\omega_1^2\right)$$

$$= \frac{1}{2}\,\frac{8\text{ lb}}{32.2\text{ ft/s}^2}\left[(4\text{ rad/s})^2\left(\frac{16}{12}\text{ft}\right)^2 + \frac{1}{4}\left(\frac{5}{12}\text{ft}\right)^2(4\text{ rad/s})^2 + \frac{1}{2}\left(\frac{5}{12}\right)^2(12)^2\right]$$

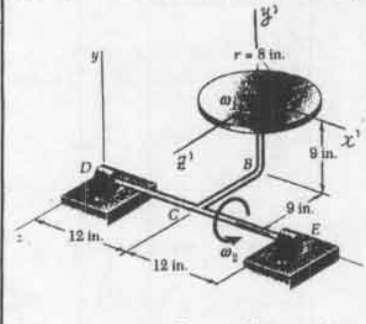
$$= (0.12422)[28.444 + 0.6944 + 12.5]$$

$$= 5.1724 \text{ ft}\cdot\text{lb}$$

$$T = 5.17 \text{ ft}\cdot\text{lb}$$

## 18.48

GIVEN:
DISK OF PROB. 18.6 WITH WEIGHT $W = 6$ lb AND ANGULAR VELOCITIES $\omega_1 = 16$ rad/s AND $\omega_2 = 8$ rad/s.
FIND: KINETIC ENERGY OF DISK.



EQ. (18.17):

$$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}(\bar{I}_{x'}\omega_{x'}^2 + \bar{I}_{y'}\omega_{y'}^2 + \bar{I}_{z'}\omega_{z'}^2)$$

WHERE $\bar{v}^2 = \omega_2^2(AC)^2$

WITH $(AC)^2 = (AB)^2 + (BC)^2$

$$(AC)^2 = 2\left(\frac{9}{12}\text{ft}\right)^2 = 1.125$$

$$\bar{I}_{x'} = \frac{1}{4}mr^2 = \frac{1}{4}m\left(\frac{8}{12}\text{ft}\right)^2 = 0.1111\,m$$

$$\bar{I}_{y'} = \frac{1}{2}mr^2 = 0.2222\,m$$

THUS: $T = \frac{1}{2}(m\bar{v}^2 + I_{x'}\omega_{x'}^2 + I_{y'}\omega_{y'}^2 + 0)$

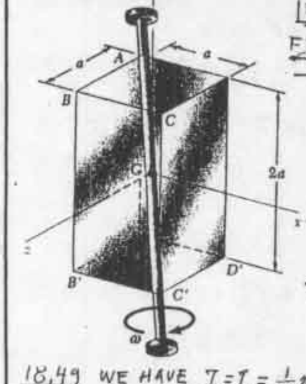
$$= \frac{1}{2}m[1.125\omega_2^2 + 0.1111\omega_2^2 + 0.2222\omega_1^2]$$

$$= \frac{1}{2}\,\frac{6\text{ lb}}{32.2\text{ ft/s}^2}[1.236(8\text{ rad/s})^2 + 0.2222(16\text{ rad/s})^2]$$

$$T = 12.67 \text{ ft}\cdot\text{lb}$$

## 18.49 and 18.50

GIVEN: PARALLELEPIPED OF
18.49: PROB. 18.7 (SOLID)
18.50: PROB. 18.8 (HOLLOW)
FIND: KINETIC ENERGY



SINCE G IS FIXED AND $x, y, z$ ARE PRINCIPAL AXES, USE (18.20):

$$T = \frac{1}{2}(I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2)$$

WITH $\omega_x = -\frac{a}{\sqrt{a^2 + a^2 + 4a^2}}\omega$

$$\omega_x = -\frac{\omega}{\sqrt{6}},\ \omega_y = \frac{2\omega}{\sqrt{6}},\ \omega_z = -\frac{\omega}{\sqrt{6}}$$

THUS: $T = \frac{1}{12}(I_x + 4I_y + I_z)\omega^2$ (1)

18.49 WE HAVE $I_x = I_z = \frac{1}{12}m[a^2 + (2a)^2] = \frac{5}{12}ma^2$, $I_y = \frac{1}{6}ma^2$

SUBSTITUTE IN (1):

$$T = \frac{1}{12}ma^2\left(\frac{5}{12} + \frac{4}{6} + \frac{5}{12}\right)\omega^2 = \frac{1}{12}ma^2\left(\frac{3}{2}\omega^2\right) \qquad T = \frac{1}{8}ma^2\omega^2$$

(CONTINUED)

## 18.49 and 18.50 continued

WE RECA... FROM THE PREVIOUS PAGE

$$T=\frac{1}{12}(I_x+4I_y+I_z)\omega^2 \qquad (1)$$

18.50: SEE SOLUTION OF PROB. 18.8 FOR THE DETERMINATION OF THE PRINCIPAL MOMENTS OF INERTIA:

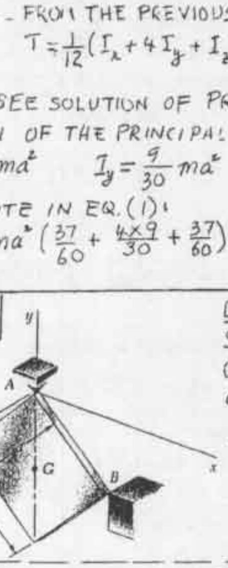
$$I_x=\frac{37}{60}ma^2 \qquad I_y=\frac{9}{30}ma^2 \qquad I_z=\frac{37}{60}ma^2$$

SUBSTITUTE IN EQ.(1):

$$T=\frac{1}{12}ma^2\left(\frac{37}{60}+\frac{4\times 9}{30}+\frac{37}{60}\right)\omega^2=\frac{146}{720}ma^2\omega^2$$

$$T=0.203\,ma^2\omega^2$$

## 18.51



GIVEN: SQUARE PLATE OF PROB. 18.29 OF MASS $m$ WITH ANG.VEL $\omega_0\underline{j}$ STRIKES $B$ WITH $e=0$

FIND: KINETIC ENERGY LOST IN IMPACT.

WE RECALL FROM PROB. 18.29 THAT $\bar{I}=\frac{1}{12}ma^2$ ABOUT ANY AXIS THROUGH G IN THE PLANE OF THE PLATE.

KINETIC ENERGY BEFORE IMPACT

$$T_0=\frac{1}{2}\bar{I}\omega_0^2=\frac{1}{2}\left(\frac{1}{12}ma^2\right)\omega_0^2=\frac{1}{24}ma^2\omega_0^2$$

KINETIC ENERGY AFTER IMPACT

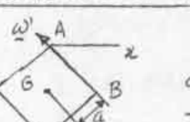


PLATE ROTATES ABOUT AB.
WE FOUND IN PROB. 18.29 THAT $\omega'=\frac{1}{4\sqrt{2}}\omega_0$ AND $\bar{v}'=\omega'(a/2)$

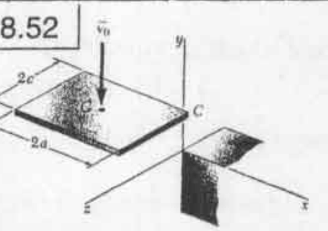
THEREFORE, FROM EQ. (18.17),

$$T=\frac{1}{2}m\bar{v}'^2+\frac{1}{2}\bar{I}\omega'^2=\frac{1}{2}m\omega'^2\left(\frac{a}{2}\right)^2+\frac{1}{2}\left(\frac{1}{12}ma^2\right)\omega'^2$$
$$=\frac{1}{6}ma^2\omega'^2=\frac{1}{6}ma^2\left(\frac{\omega_0}{4\sqrt{2}}\right)^2=\frac{1}{192}ma^2\omega_0^2$$

KINETIC ENERGY LOST

$$=\frac{1}{24}ma^2\omega_0^2-\frac{1}{192}ma^2\omega_0^2=\frac{7}{192}ma^2\omega_0^2$$

## 18.52



GIVEN: RECTANGULAR PLATE OF PROBS. 18.31 AND 18.32 OF MASS $m$ FALLING WITH VELOCITY $\bar{v}_0$ AND $\omega_0=0$ HITS OBSTRUCTION ($e=0$)

FIND: KINETIC ENERGY LOST IN IMPACT.

BEFORE IMPACT $\qquad T_0=\frac{1}{2}m\bar{v}_0^2$

AFTER IMPACT

FROM PROB.(18.31): $\omega_x=3\bar{v}_0/7c,\ \omega_y=0,\ \omega_z=3\bar{v}_0/7a$

FROM PROB.(18.32): $\bar{v}=-(6\bar{v}_0/7)\underline{j}$

EQ.(18.17):

$$T=\frac{1}{2}m\bar{v}^2+\frac{1}{2}\left(\bar{I}_{x'}\omega_x^2+\bar{I}_{y'}\omega_y^2+\bar{I}_{z'}\omega_z^2\right)$$
$$=\frac{1}{2}m\left(\frac{6}{7}\bar{v}_0\right)^2+\frac{1}{2}\left[\frac{1}{3}mc^2\left(\frac{3\bar{v}_0}{7c}\right)^2+0+\frac{1}{3}ma^2\left(\frac{3\bar{v}_0}{7a}\right)^2\right]$$
$$=\frac{1}{2}m\bar{v}_0^2\left(\frac{1}{7}\right)^2[36+3+3]=\frac{1}{2}m\bar{v}_0^2\frac{42}{49}=\frac{1}{2}\frac{6}{7}m\bar{v}_0^2$$

KINETIC ENERGY LOST

$$T_0-T=\frac{1}{2}m\bar{v}_0^2\left(1-\frac{6}{7}\right) \qquad T_0-T=\frac{1}{14}m\bar{v}_0^2$$

## 18.53

GIVEN: SPACE PROBE OF PROB. 18.35, WITH $W=3000$ lb, $k_x=1.375$ ft, $k_y=1.425$ ft, $k_z=1.250$ ft.

FIND: KINETIC ENERGY OF PROBE IN ITS MOTION ABOUT ITS MASS CENTER AFTER ITS COLLISION WITH METEORITE.

SEE SOLUTION OF PROB. 18.35 FOR DETERMINATION OF

$$\omega_x=0.0248\text{ rad/s},\quad \omega_y=-0.277\text{ rad/s},\quad \omega_z=-0.360\text{ rad/s}$$

IN MOTION ABOUT G, G IS A FIXED POINT AND THE $x,y,z$ AXES ARE PRINCIPAL AXES. WE USE EQ (18.20):

$$T'=\frac{1}{2}(I_x\omega_x^2+I_y\omega_y^2+I_z\omega_z^2)=\frac{1}{2}m(k_x^2\omega_x^2+k_y^2\omega_y^2+k_z^2\omega_z^2)$$
$$=\frac{1}{2}\frac{3000\text{ lb}}{32.2\text{ ft/s}^2}\left[(1.375\text{ ft}\times 0.0248\text{ rad/s})^2+(1.425\text{ ft}\times 0.277\text{ rad/s})^2+(1.250\text{ ft}\times 0.360\text{ rad/s})^2\right]$$

FIND:
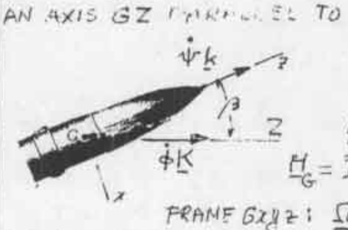
(a) APPROXIMATE VALUE OF RATE OF PRECESSION,
(b) EXACT VALUES OF TWO POSSIBLE RATES OF PRECESSION

SINCE THE DRAG $\underline{D}$ IS A FORCE CONSTANT IN MAGNITUDE AND DIRECTION (LIKE THE WEIGHT OF A TOP), IT WILL PRECESS, LIKE A TOP, ABOUT AN AXIS GZ PARALLEL TO THAT FORCE.



USING THE AXES Gxyz, WITH y POINTING AWAY FROM PROJECTILE:

$\underline{\omega} = \dot{\phi}\sin\beta\,\underline{i} + (\dot{\psi} + \dot{\phi}\cos\beta)\underline{k}$

$\underline{H}_G = \bar{I}_x\,\dot{\phi}\sin\beta\,\underline{i} + \bar{I}_z(\dot{\psi} + \dot{\phi}\cos\beta)\underline{k}$

FRAME Gxyz: $\underline{\Omega} = \dot{\phi}\sin\beta\,\underline{i} + \dot{\phi}\cos\beta\,\underline{k}$

EQ. (18.22): $\dot{\underline{H}}_G = (\dot{\underline{H}}_G)_{Gxyz} + \underline{\Omega}\times\underline{H}_G = 0 + \underline{\Omega}\times\underline{H}_G$

$\dot{\underline{H}}_G = (\dot{\phi}\sin\beta\,\underline{i} + \dot{\phi}\cos\beta\,\underline{k})\times[\bar{I}_x\dot{\phi}\sin\beta\,\underline{i} + \bar{I}_z(\dot{\psi} + \dot{\phi}\cos\beta)\underline{k}]$

$= \dot{\phi}\sin\beta\,[-\bar{I}_z(\dot{\psi} + \dot{\phi}\cos\beta) + \bar{I}_x\dot{\phi}\cos\beta]\,\underline{j}$

THUS: $\Sigma(\underline{M}_G)_{eff} = \dot{\underline{H}}_G = \dot{\phi}\sin\beta[(\bar{I}_x - \bar{I}_z)\dot{\phi}\cos\beta - \bar{I}_z\dot{\psi}]\,\underline{j}$ (1)

ON THE OTHER HAND,
$\Sigma\underline{M}_G = c\underline{k}\times(-D\underline{K}) = -cD\sin\beta\,\underline{j}$ (2)

$\Sigma\underline{M}_G = \Sigma(\underline{M}_G)_{eff}$: $-cD = \dot{\phi}[(\bar{I}_x - \bar{I}_z)\dot{\phi}\cos\beta - \bar{I}_z\dot{\psi}]$ (3)

(a) APPROXIMATE VALUE OF $\dot{\phi}$
SINCE $\dot{\psi} \gg \dot{\phi}$, WE MAY NEGLECT THE FIRST TERM IN THE BRACKET IN (3). WE OBTAIN

$$\bar{I}_z\dot{\phi}\dot{\psi} = cD \quad (4)$$

WITH GIVEN DATA: $\bar{I}_z = m\bar{k}_z^2 = (20\,kg)(0.05\,m)^2 = 0.05\,kg\cdot m^2$
$c = 0.15\,m$, $D = 120\,N$, $\dot{\psi} = 6000\text{ rpm} = 200\pi\text{ rad/s}$:

$0.05\,\dot{\phi}\,(200\pi) = (0.15)(120)$ $\qquad \dot{\phi} = 0.5730\text{ rad/s}$

$\dot{\phi} = 5.47\text{ rpm}$

(b) EXACT VALUES OF $\dot{\phi}$
USING EQ. (3) WITH THE ABOVE DATA AND WITH $\beta = 3°$ AND $\bar{I}_x = m\bar{k}_x^2 = (20\,kg)(0.2\,m)^2 = 0.8\,kg\cdot m^2$:

$-(0.15\,m)(120\,N) = \dot{\phi}[(0.8 - 0.05)\dot{\phi}\cos 3° - 0.05(200\pi)]$

$0.74897\,\dot{\phi}^2 - 31.416\,\dot{\phi} + 18 = 0$

$\dot{\phi}^2 - 41.945\,\dot{\phi} + 24.033 = 0$

$\dot{\phi} = \frac{1}{2}\left(41.945 \pm \sqrt{(41.945)^2 - 4(24.033)}\right)$

$= \frac{1}{2}(41.945 \pm 40.783)\text{ rad/s}$

$\dot{\phi} = 41.364\text{ rad/s}$ or $\dot{\phi} = 0.58101\text{ rad/s}$

$\dot{\phi} = 395\text{ rpm}$ AND $\dot{\phi} = 5.55\text{ rpm}$

(b) FROM RELATION JUST OBTAINED, WE HAVE
$$I\omega_z - I'\dot{\phi}\cos\theta = 0$$
WHICH SHOWS THAT, FOR AN AXISYMMETRICAL BODY UNDER NO FORCE, THE R. H. MEMBER OF
$$\Sigma\underline{M}_0 = (I\omega_z - I'\dot{\phi}\cos\theta)\,\dot{\phi}\sin\theta\,\underline{j} \quad (18.44)$$
IS EQUAL TO ZERO. BUT, SINCE THERE IS NO FORCE, WE ALSO HAVE $\Sigma\underline{M}_0 = 0$ AND EQ. (18.44) IS SATISFIED. (Q.E.D)

## 18.121 GIVEN:

AXISYMMETRICAL BODY UNDER NO FORCE

$I$ = MOMENT OF INERTIA ABOUT AXIS OF SYMMETRY.

$I'$ = — — — — TRANSVERSE AXIS THRU G

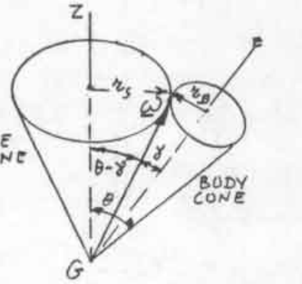
$\omega_z$ = COMPONENT OF $\underline{\omega}$ ALONG AXIS OF SYMMETRY.

SHOW THAT:

ANGULAR VELOCITY $\underline{\omega}$ IS OBSERVED FROM THE BODY TO ROTATE ABOUT THE AXIS OF SYMMETRY AT THE RATE

$$n = \frac{I'-I}{I'}\,\omega_z$$

---



ASSUMING DIRECT PRECESSION ($I' > I$), WE CONSIDER THE SPACE AND BODY CONES. THE PLANE ZGz ROTATES ABOUT THE Z AXIS AT THE RATE $\dot\phi$; SO WILL THE VECTOR $\underline{\omega}$ CONTAINED IN THAT PLANE. THUS, THE TIP OF $\underline{\omega}$ WILL DESCRIBE AN ARC OF CIRCLE OF LENGTH $r_s\dot\phi\,\Delta t$ IN THE TIME $\Delta t$. BUT, ACCORDING TO THE DEFINITION OF $n$, THE VECTOR $\underline{\omega}$ IS OBSERVED TO ROTATE AT THE RATE $n$ WITH RESPECT TO THE BODY. THUS THE TIP OF $\underline{\omega}$ WILL DESCRIBE AN ARC OF CIRCLE OF LENGTH $r_B\,n\,\Delta t$ IN THE TIME $\Delta t$. SINCE THE BODY CONE ROLLS ON THE SPACE CONE, WE HAVE

$$r_s\dot\phi\,\Delta t = r_B\,n\,\Delta t \qquad (1)$$

BUT, FROM THE SKETCH ABOVE,

$$r_s = \omega\sin(\theta-\gamma) \quad \text{AND} \quad r_B = \omega\sin\gamma$$

SUBSTITUTING INTO (1):

$$\dot\phi\sin(\theta-\gamma) = n\sin\gamma$$

$$n = \dot\phi\,\frac{\sin(\theta-\gamma)}{\sin\gamma} \qquad (2)$$

WE RECALL THE RELATION DERIVED IN PROB 18.120:

$$\dot\phi = \frac{I\omega_z}{I'\cos\theta}$$

SUBSTITUTING INTO (2) AND EXPANDING $\sin(\theta-\gamma)$:

$$n = \frac{I\omega_z}{I'\cos\theta}\;\frac{\sin\theta\cos\gamma-\sin\gamma\cos\theta}{\sin\gamma}$$

$$= \frac{I\omega_z}{I'}\left(\frac{\tan\theta}{\tan\gamma}-1\right)$$

RECALLING FROM EQ. (18.49) THAT $\frac{\tan\theta}{\tan\gamma} = \frac{I'}{I}$, WE HAVE

$$n = \frac{I}{I'}\left(\frac{I'}{I}-1\right)\omega_z$$

$$n = \frac{I'-I}{I'}\,\omega_z \quad (\text{Q.E.D.})$$

NOTE. FOR $I > I'$ (RETROGRADE PRECESSION), WE WOULD FIND

$$n = \frac{I-I'}{I'}\,\omega_z$$

## 18.122 GIVEN:

AXISYMMETRICAL BODY UNDER NO FORCE AND IN RETROGRADE PRECESSION ($I > I'$).

SHOW THAT:

(a) RATE OF RETROGRADE PRECESSION CANNOT BE LESS THAN TWICE THE RATE OF SPIN: $|\dot\phi| \ge 2|\dot\psi|$,

(b) THE AXIS OF SYMMETRY IN FIG. 18.24 CAN NEVER LIE WITHIN THE SPACE CONE.

---

(a) WE RECALL THE RELATION DERIVED IN PROB. 18.120:

$$\dot\phi = \frac{I\omega_z}{I'\cos\theta} \qquad (1)$$

OR

$$I'\dot\phi\cos\theta = I\omega_z$$

SUBSTITUTING $\omega_z = \dot\psi + \dot\phi\cos\theta$, WE HAVE

$$I'\dot\phi\cos\theta = I(\dot\psi+\dot\phi\cos\theta)$$

SOLVING FOR $\dot\phi$,

$$\dot\phi = -\frac{I}{I-I'}\,\frac{\dot\psi}{\cos\theta} \quad \text{OR} \quad \dot\phi = -\frac{\sec\theta}{1-(I'/I)}\,\dot\psi \qquad (2)$$

FOR RETROGRADE PRECESSION, $I'/I < 1$

ON THE OTHER HAND, THE SMALLEST POSSIBLE VALUE OF $I'/I$ IS $1/2$ (WHICH CORRESPONDS TO THE CASE OF A FLAT DISK OR ANNULUS).

THUS:

$$\frac{1}{2} \le \frac{I'}{I} < 1 \quad \text{OR} \quad \frac{1}{2} \ge 1-\frac{I'}{I} > 0$$

$$\text{OR} \quad \frac{1}{1-(I/I')} \ge 2$$

RECALLING THAT $\sec\theta \ge 1$, WE MUST HAVE FROM (2)

$$|\dot\phi| \ge 2|\dot\psi| \quad (\text{Q.E.D.})$$

(b) WE RECALL EQ. (18.49):

$$\tan\gamma = \frac{I}{I'}\tan\theta$$

SINCE $\frac{I'}{I} \ge \frac{1}{2}$ AS SHOWN ABOVE, $\frac{I}{I'} \le 2$ AND

$$\tan\gamma \le 2\tan\theta \qquad (3)$$

WE WRITE THE TRIGONOMETRIC IDENTITY

$$\tan(\gamma-\theta) = \frac{\tan\gamma-\tan\theta}{1+\tan\gamma\tan\theta}$$

SINCE $\gamma < \frac{\pi}{2}$ AND $\theta < \frac{\pi}{2}$, WE HAVE $1+\tan\gamma\tan\theta \ge 1$

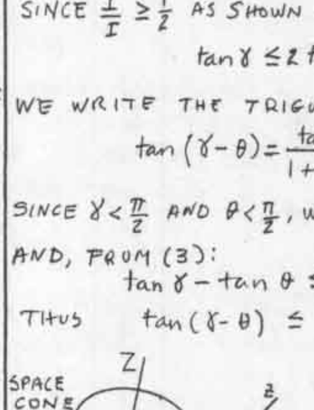
AND, FROM (3):

$$\tan\gamma - \tan\theta \le \tan\theta$$

$$\text{THUS} \quad \tan(\gamma-\theta) \le \frac{\tan\theta}{1}$$

$$\tan(\gamma-\theta) \le \tan\theta$$

$$\gamma-\theta \le \theta$$



THE z AXIS CANNOT LIE WITHIN THE SPACE CONE (SEE SKETCH) (Q.E.D.)

GIVEN:

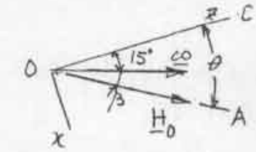
FOOTBALL KICKED WITH HORIZONTAL ANG. VEL. $\underline{\omega}$ OF MAGNITUDE 200 rpm. RATIO OF AXIAL AND TRANSVERSE MOMENTS OF INERTIA IS $I/I' = 1/3$.

FIND:

(a) ANGLE $\beta$ BETWEEN $\underline{\omega}$ AND PRECESSION AXIS OA.
(b) RATES OF PRECESSION AND SPIN.

---

(a) USING REFERENCE FRAME $Oxyz$ WITH $y$ POINTING AWAY.



$$\omega_x = \omega \sin 15°$$
$$\omega_y = 0$$
$$\omega_z = \omega \cos 15°$$

GIVEN:

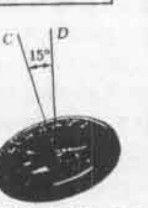
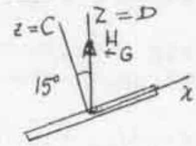
COIN SPINS AT THE RATE OF 600 rpm ABOUT AXIS GC PERPENDICULAR TO COIN AND PRECESSES ABOUT VERTICAL DIRECTION GD.



FIND:

(a) ANGLE BETWEEN $\underline{\omega}$ AND GD,

(b) RATE OF PRECESSION ABOUT GD.



IT FOLLOWS FROM THE ABOVE STATEMENT THAT $\underline{H}_G$ IS DIRECTED AS SHOWN AND THAT THE ANGLE BETWEEN THE AXES OF SPIN AND PRECESSION IS $\theta = 15°$

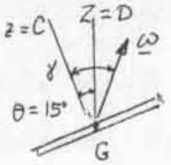
FOR DISK:

$$I = I_z = \frac{1}{2} m r^2 \qquad I' = I_x = \frac{1}{4} m r^2$$

EQ. (18.49):

$$\tan\gamma = \frac{I}{I'}\tan\theta = 2\tan 15° \qquad \gamma = 28.187°$$

(a) ANGLE BETWEEN $\underline{\omega}$ AND GD



THE ANGLE $\gamma$ WE HAVE FOUND IS THE ANGLE BETWEEN $\underline{\omega}$ AND GC. THE ANGLE BETWEEN $\underline{\omega}$ AND GD IS

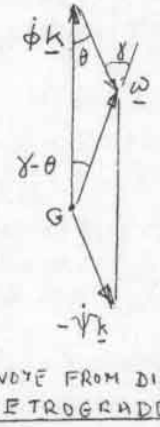
$$\gamma - \theta = 28.187° - 15° = 13.187°$$

$$\gamma - \theta = 13.19°$$

(b) RATE OF PRECESSION

THE RATE OF SPIN IS $\dot\psi = 600$ rpm

RESOLVING THE ANGULAR VELOCITY $\underline{\omega}$ INTO ITS SPIN COMPONENT $\dot\psi\underline{k}$ AND ITS PRECESSION COMPONENT $\dot\phi\underline{K}$, WE DRAW THE FOLLOWING DIAGRAM:



LAW OF SINES:

$$\frac{\dot\phi}{\sin\gamma} = \frac{\dot\psi}{\sin(\gamma-\theta)}$$

$$\dot\phi = \dot\psi\,\frac{\sin\gamma}{\sin(\gamma-\theta)} = (600\text{rpm})\frac{\sin 28.187°}{\sin 13.187°}$$

$$\dot\phi = 1242 \text{ rpm}$$

WE NOTE FROM DIAGRAM THAT THE PRECESSION IS RETROGRADE

THIS COULD HAVE BEEN ANTICIPATED, SINCE $I/I' = 2 > 1$.

SOLVE SAMPLE PROB. 18.6, ASSUMING THAT THE METEORITE STRIKES THE SATELLITE AT C WITH $\underline{v}_0 = (2000\text{ m/s})\underline{i}$.

(a) ANGULAR VELOCITY AFTER IMPACT

FROM SAMPLE PROB. 18.6:

$$I = I_z = \frac{1}{2} m a^2 \qquad I' = I_x = I_y = \frac{5}{4} m a^2$$

ANG. MOMENTUM AFTER IMPACT:

$$\underline{H}_G = \underline{r}_C \times m_0\underline{v}_0 + I\omega_0\underline{k}$$
$$= (-a\underline{j} - a\underline{k}) \times m_0 v_0 \underline{i} + I\omega_0\underline{k}$$
$$\underline{H}_G = -m_0 v_0 a\underline{j} + (I\omega_0 + m_0 v_0 a)\underline{k} \qquad (1)$$

BUT $\underline{H}_G = I'\omega_x\underline{i} + I'\omega_y\underline{j} + I\omega_z\underline{k}$ (2)

EQUATING THE COEFF. OF THE UNIT VECTORS IN (1) AND (2)

$$\omega_x = 0 \qquad \omega_y = -\frac{m_0 v_0 a}{I'} = -\frac{4}{5}\frac{m_0 v_0}{m a}$$

$$\omega_z = \omega_0 + \frac{m_0 v_0 a}{I} = \omega_0 + 2\frac{m_0 v_0}{m a}$$

GIVEN DATA: $\omega_0 = 60$ rpm $= 6.283$ rad/s

$\frac{m_0}{m} = 0.001 \qquad a = 0.8$ m $\qquad v_0 = 2000$ m/s

WE FIND

$$\omega_x = 0 \qquad \omega_y = -2 \text{ rad/s} \qquad \omega_z = 11.283 \text{ rad/s}$$

$$\omega = \sqrt{\omega_y^2 + \omega_z^2} = 11.459 \text{ rad/s} \qquad \omega = 109.4 \text{ rpm}$$

$$\cos\gamma_x = 0 \qquad \cos\gamma_y = \frac{\omega_y}{\omega} = -0.17453 \qquad \cos\gamma_z = \frac{\omega_z}{\omega} = 0.98464$$

$$\gamma_x = 90°, \quad \gamma_y = 100.05°, \quad \gamma_z = 10.05°$$

(b) PRECESSION AXIS

SINCE IT IS DIRECTED ALONG $\underline{H}_G$, WE USE EQ (1) AND WRITE

$$H_x = 0, \quad H_y = -m_0 v_0 a = -\frac{m}{1000}(2000)(0.8) = -(1.6)m$$

$$H_z = I\omega_0 + m_0 v_0 a = \frac{1}{2} m a^2\omega_0 + m_0 v_0 a$$
$$= \frac{1}{2} m (0.8)^2 (6.283) + (1.6)m = (3.6106)m$$

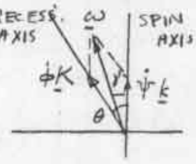
$$H_G = \sqrt{H_y^2 + H_z^2} = (3.9492)m$$

$$\cos\theta_x = 0, \quad \cos\theta_y = \frac{H_y}{H_G} = -0.40515, \quad \cos\theta_z = \frac{H_z}{H_G} = 0.91425$$

DIRECTION OF PRECESSION AXIS IS

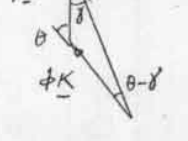
$$\theta_x = 90°, \quad \theta_y = 113.9°, \quad \theta_z = 23.9°$$

(c) RATES OF PRECESSION AND SPIN



WE HAVE

$$\theta = \theta_z = 23.9°$$
$$\gamma = \gamma_z = 10.05°$$
$$\theta - \gamma = 13.85°$$



LAW OF SINES:

$$\frac{\omega}{\sin\theta} = \frac{\dot\phi}{\sin\gamma} = \frac{\dot\psi}{\sin(\theta-\gamma)}$$

$$\frac{109.4\text{rpm}}{\sin 23.9°} = \frac{\dot\phi}{\sin 10.05°} = \frac{\dot\psi}{\sin 13.85°}$$

SOLVING FOR $\dot\phi$ AND $\dot\psi$

RATE OF PRECESSION $= \dot\phi = 47.1$ rpm

RATE OF SPIN $= \dot\psi = 64.6$ rpm

$$I(\dot\psi + \dot\phi\cos\theta) = \beta \quad (2)$$

(b) $\omega_z$ = CONST. AND $\dot\phi$ = FUNCTION OF $\theta$

WE USE FRAME $Oxyz$ WITH $y$ AXIS POINTING INTO PAPER

ANG. VELOCITY OF TOP:
$$\underline{\omega} = -\dot\phi\sin\theta\,\underline{i} + \dot\theta\,\underline{j} + (\dot\psi + \dot\phi\cos\theta)\underline{k} \quad (A)$$
ANG. VELOCITY OF FRAME:
$$\underline{\Omega} = -\dot\phi\sin\theta\,\underline{i} + \dot\theta\,\underline{j} + \dot\phi\cos\theta\,\underline{k} \quad (B)$$
ANG. MOMENTUM ABOUT O:
$$\underline{H}_O = I_x\omega_x\underline{i} + I_y\omega_y\underline{j} + I_z\omega_z\underline{k}$$
$$\underline{H}_O = -I'\dot\phi\sin\theta\,\underline{i} + I'\dot\theta\,\underline{j} + I(\dot\psi + \dot\phi\cos\theta)\underline{k} \quad (C)$$

(a) WE RECALL $\quad \Sigma \underline{M}_O = \dot{\underline{H}}_O \quad (18.27)$

SINCE THE ONLY EXTERNAL FORCES ARE THE REACTION AT O AND THE WEIGHT $\underline{W} = -mg\underline{K}$ AT G, WE HAVE $\Sigma M_Z = 0$ AND FROM (18.27) $\dot H_Z = 0$. SINCE THE Z AXIS IS PART OF A NEWTONIAN FRAME OF REFERENCE, IT FOLLOWS THAT $H_Z$ = constant. BUT $H_Z = \underline{H}_O \cdot \underline{K}$.
SUBSTITUTING FOR $\underline{H}_O$ FROM (C) AND NOTING THAT $\underline{i}\cdot\underline{K} = -\sin\theta$, $\underline{j}\cdot\underline{K} = 0$, $\underline{k}\cdot\underline{K} = \cos\theta$, WE HAVE
$$H_Z = \underline{H}_O\cdot \underline{K} = -I'\dot\phi\sin\theta(-\sin\theta) + 0 + I(\dot\psi + \dot\phi\cos\theta)\cos\theta$$
THUS: $$I'\dot\phi\sin^2\theta + I(\dot\psi + \dot\phi\cos\theta)\cos\theta = \alpha \quad (1)$$
WHERE $\alpha$ IS A CONSTANT.

WE OBSERVE THAT WE ALSO HAVE $\Sigma M_z = 0$, BUT WE CANNOT CONCLUDE THAT $H_z$ = const., SINCE THE z AXIS IS NOT PART OF A NEWTONIAN FRAME OF REFERENCE.
USING EQ. (18.28), WE WRITE
$$\Sigma M_O = (\dot{\underline{H}}_O)_{Oxyz} + \underline{\Omega}\times\underline{H}_O \quad (18.28)$$
SUBSTITUTING FROM (B) AND (C) INTO (18.28),
$$\Sigma \underline{M}_O = -I'\frac{d}{dt}(\dot\phi\sin\theta)\underline{i} + I'\ddot\theta\underline{j} + I\frac{d}{dt}(\dot\psi + \dot\phi\cos\theta)\underline{k} + (-\dot\phi\sin\theta\underline{i} + \dot\theta\underline{j} + \dot\phi\cos\theta\underline{k})\times[-I'\dot\phi\sin\theta\underline{i} + I'\dot\theta\underline{j} + I(\dot\psi + \dot\phi\cos\theta)\underline{k}]$$
CONSIDERING ONLY THE COEFFICIENTS OF $\underline{k}$, WE OBTAIN
$$\Sigma M_z = I\frac{d}{dt}(\dot\psi + \dot\phi\cos\theta) - I'\dot\phi\dot\theta\sin\theta + I'\dot\phi\dot\theta\sin\theta = 0$$
BUT THE SECOND AND THIRD TERMS CANCEL OUT, DUE TO <u>THE AXISYMMETRY OF THE TOP</u>. THUS
$$\Sigma M_z = I\frac{d}{dt}(\dot\psi + \dot\phi\cos\theta) = 0$$
AND $$I(\dot\psi + \dot\phi\cos\theta) = \beta \quad (2)$$
WHERE $\beta$ IS A CONSTANT

(b) FROM EQ. (A) WE HAVE $\omega_z = \dot\psi + \dot\phi\cos\theta$ AND, IN VIEW OF (2):
$$\omega_z = \beta/I = \text{constant} \quad (3)$$
SUBSTITUTING FOR $I(\dot\psi + \dot\phi\cos\theta)$ FROM (2) INTO (1):
$$I'\dot\phi\sin^2\theta + \beta\cos\theta = \alpha \quad (4)$$
$$\dot\phi = \frac{\alpha - \beta\cos\theta}{I'\sin^2\theta} \quad (\text{FUNCTION OF } \theta) \quad (5)$$

SHOW THAT:
(a) A THIRD EQUATION OF MOTION CAN BE OBTAINED FROM THE PRINCIPLE OF CONSERVATION OF ENERGY.
(b) BY ELIMINATING $\dot\phi$ AND $\dot\psi$ FROM THAT EQUATION AND EQS (1) AND (2) OF PROB. 18.140 AN EQUATION $\dot\theta^2 = f(\theta)$ CAN BE OBTAINED, WHERE
$$f(\theta) = \frac{1}{I'}\left(2E - \frac{\beta^2}{I} - 2mgc\cos\theta\right) - \left(\frac{\alpha - \beta\cos\theta}{I'\sin\theta}\right)^2 \quad (1)$$
(c) BY INTRODUCING THE VARIABLE $x = \cos\theta$, THE MAX. AND MIN. VALUES OF $\theta$ CAN BE OBTAINED BY SOLVING THE CUBIC EQUATION

REFERRING TO EQ. (A) OF PROB. 18.139:
$$T = \tfrac12[I'\dot\phi^2\sin^2\theta + I'\dot\theta^2 + I(\dot\psi + \dot\phi\cos\theta)^2], \qquad V = mgc\cos\theta$$
$T + V = E$:
$$\tfrac12[I'\dot\phi^2\sin^2\theta + I'\dot\theta^2 + I(\dot\psi + \dot\phi\cos\theta)^2] + mgc\cos\theta = E \quad (6)$$

(b) SUBSTITUTING IN (6) FOR $\dot\phi$ FROM EQ. (5) OF PROB. 18.139 AND FOR $(\dot\psi + \dot\phi\cos\theta)$ FROM EQ. (2) OF PROB. 18.139, AND MULTIPLYING BY 2:
$$I'\left(\frac{\alpha - \beta\cos\theta}{I'\sin^2\theta}\right)^2\sin^2\theta + I'\dot\theta^2 + I\left(\frac{\beta}{I}\right)^2 + 2mgc\cos\theta = 2E$$
$$\frac{(\alpha - \beta\cos\theta)^2}{I'\sin^2\theta} + I'\dot\theta^2 + \frac{\beta^2}{I} + 2mgc\cos\theta = 2E$$
SOLVING FOR $\dot\theta^2$, WE OBTAIN
$$\dot\theta^2 = f(\theta)$$
WHERE
$$f(\theta) = \frac{1}{I'}\left(2E - \frac{\beta^2}{I} - 2mgc\cos\theta\right) - \left(\frac{\alpha - \beta\cos\theta}{I'\sin\theta}\right)^2$$

(c) SETTING $\cos\theta = x$,
$$f(\theta) = \frac{1}{I'}\left(2E - \frac{\beta^2}{I} - 2mgcx\right) - \frac{(\alpha - \beta x)^2}{I'^2(1 - x^2)}$$
LETTING $f(\theta) = 0$ AND MULTIPLYING BY $I'(1 - x^2)$,
WE OBTAIN THE CUBIC EQUATION $F(x) = 0$:
$$\left(2E - \frac{\beta^2}{I} - 2mgcx\right)(1 - x^2) - \frac{1}{I'}(\alpha - \beta x)^2 = 0$$

SOLVING THIS EQUATION WILL YIELD THREE VALUES OF $x$. THE TWO VALUES COMPRISED BETWEEN −1 AND +1 CORRESPOND TO THE MAX. AND MIN. VALUES OF $\theta$.

EQ.(4) IS THE EQUATION OF AN ELLIPSOID ON WHICH THE TIP OF $\underline{\omega}$ MUST LIE. THIS IS POINSOT ELLIPSOID. COMPARING EQ.(4) WITH EQ.(9.49) OF SEC. 9.17, WE NOTE THAT POINSOT ELLIPSOID HAS THE SAME SHAPE AS THE ELLIPSOID OF INERTIA OF THE BODY, BUT A DIFFERENT SIZE.

---

(a) AT THE TIP OF $\underline{\omega}$ THE DIRECTION OF THE NORMAL TO THE ELLIPSOID IS THAT OF grad $F(\omega_x, \omega_y, \omega_z)$, WHERE F DENOTES THE LEFT-HAND MEMBER OF EQ.(4) OF PROB. 18.143. FROM SEC. 13.7:

$$\text{grad } F = \frac{\partial F}{\partial\omega_x}\underline{i} + \frac{\partial F}{\partial\omega_y}\underline{j} + \frac{\partial F}{\partial\omega_z}\underline{k}$$
$$= 2I_x\omega_x\underline{i} + 2I_y\omega_y\underline{j} + 2I_z\omega_z\underline{k}$$
$$= 2(I_x\omega_x\underline{i} + I_y\omega_y\underline{j} + I_z\omega_z\underline{k}) = 2\underline{H}_O$$

## *18.144 continued

(b) THE POINSOT ELLIPSOID IS PART OF THE BODY WHOSE MOTION IS BEING ANALYZED, AND ITS POINT OF CONTACT WITH THE INVARIABLE PLANE IS THE TIP OF THE VECTOR $\underline{\omega}$. FURTHER SHOW THAT
(a) THE TWO CONES ARE TANGENT EXTERNALLY AND THE PRECESSION IS DIRECT WHEN $I < I'$,
WHERE $I$ = MOM. OF INERTIA ABOUT AXIS OF SYMMETRY

WHICH IS THE EQUATION OF AN ELLIPSOID OF REVOLUTION.
IT FOLLOWS THAT THE TIP OF $\underline{\omega}$ DESCRIBES CIRCLES ON BOTH THE POINSOT ELLIPSOID AND THE INVARIABLE PLANE, AND THAT THE VECTOR $\underline{\omega}$ ITSELF DESCRIBES CIRCULAR BODY AND SPACE CONES
THE POINSOT ELLIPSOID, THE INVARIABLE PLANE AND THE BODY AND SPACE CONES ARE SHOWN BELOW FOR CASES a AND b:

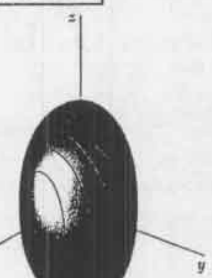
## *18.146



GIVEN: RIGID BODY OF ARBITRARY SHAPE AND ITS POINSOT ELLIPSOID (CF. PROBS. 18.143 AND 18.144.
SHOW THAT:
(a) CURVE DESCRIBED BY TIP OF $\underline{\omega}$ ON POINSOT ELLIPSOID IS DEFINED BY

$$I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2 = 2T = \text{constant} \quad (1)$$
$$I_x^2\omega_x^2 + I_y^2\omega_y^2 + I_z^2\omega_z^2 = H_O^2 = \text{constant} \quad (2)$$

AND CAN THUS BE OBTAINED BY INTERSECTING THE POINSOT ELLIPSOID WITH THE ELLIPSOID DEFINED BY (2).
(b) ASSUMING $I_x > I_y > I_z$, THE CURVES (CALLED POLHODES) OBTAINED FOR VARIOUS VALUES OF $H_O$ HAVE THE SHAPES INDICATED IN FIGURE
(c) THE BODY CAN ROTATE ABOUT A FIXED AXIS ONLY IF THAT AXIS COINCIDES WITH ONE OF THE PRINCIPAL AXES, THIS MOTION BEING STABLE IF THE AXIS IS THE MAJOR OR MINOR AXIS OF THE POINSOT ELLIPSOID ($x$ OR $z$ AXIS) AND UNSTABLE IF IT IS THE INTERMEDIATE AXIS ($y$ AXIS).

---

(a) EQ.(1) IN STATEMENT EXPRESSES CONSERVATION OF ENERGY; THIS IS EQ.(4) OF PROB. 18.143.
WE NOW EXPRESS THAT THE MAGNITUDE OF $\underline{H}_O$ IS CONSTANT:

$$H_O^2 = H_x^2 + H_y^2 + H_z^2 = I_x^2\omega_x^2 + I_y^2\omega_y^2 + I_z^2\omega_z^2 = \text{const.}$$

WHICH IS EQ (2) IN STATEMENT. SINCE THE COORDINATES $\omega_x, \omega_y, \omega_z$ OF THE TIP OF $\underline{\omega}$ MUST SATISFY BOTH EQS. (1) AND (2), THE CURVE DESCRIBED BY THE TIP OF $\underline{\omega}$ IS THE INTERSECTION OF THE TWO ELLIPSOIDS.
(b) WE NOW WRITE THE EQUATIONS OF THE TWO ELLIPSOIDS IN THE STANDARD FORM

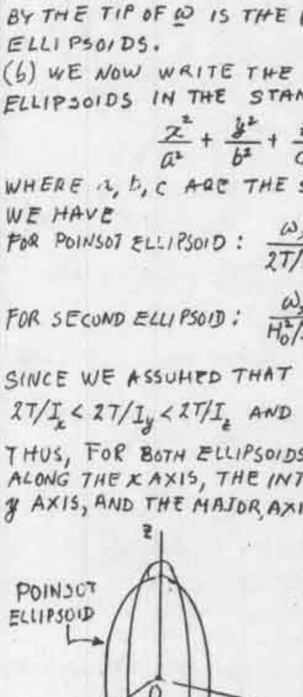
$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

WHERE $a, b, c$ ARE THE SEMI-AXES OF THE ELLIPSOID.
WE HAVE

FOR POINSOT ELLIPSOID: $$\frac{\omega_x^2}{2T/I_x} + \frac{\omega_y^2}{2T/I_y} + \frac{\omega_z^2}{2T/I_z} = 1 \quad (3)$$

FOR SECOND ELLIPSOID: $$\frac{\omega_x^2}{H_O^2/I_x^2} + \frac{\omega_y^2}{H_O^2/I_y^2} + \frac{\omega_z^2}{H_O^2/I_z^2} = 1 \quad (4)$$

SINCE WE ASSUMED THAT $I_x > I_y > I_z$, WE HAVE
$2T/I_x < 2T/I_y < 2T/I_z$ AND $H_O^2/I_x^2 < H_O^2/I_y^2 < H_O^2/I_z^2$
THUS, FOR BOTH ELLIPSOIDS, THE MINOR AXIS IS DIRECTED ALONG THE $x$ AXIS, THE INTERMEDIATE AXIS ALONG THE $y$ AXIS, AND THE MAJOR AXIS ALONG THE $z$ AXIS.

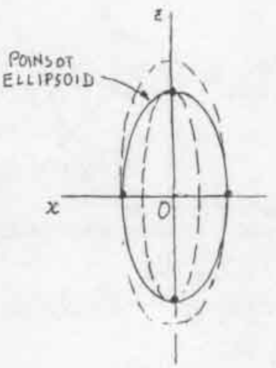


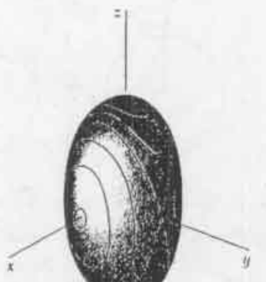
HOWEVER, BECAUSE THE RATIO OF THE MAJOR TO THE MINOR SEMIAXIS IS $\sqrt{I_x/I_z}$ FOR THE POINSOT ELLIPSOID AND $I_x/I_z$ FOR THE SECOND ELLIPSOID, THE SHAPE OF THE LATTER WILL BE MORE "PRONOUNCED".

(CONTINUED)

## *18.146 continued

THE LARGEST ELLIPSOID OF THE SECOND TYPE TO BE IN CONTACT WITH THE POINSOT ELLIPSOID WILL BE OUTSIDE THAT ELLIPSOID AND TOUCH IT AT ITS POINTS OF INTERSECTION WITH THE $x$ AXIS, AND THE SMALLEST WILL BE INSIDE THE POINSOT ELLIPSOID AND TOUCH IT AT ITS POINTS OF INTERSECTION WITH THE $z$ AXIS (SEE LEFT-HAND SKETCH). ALL ELLIPSOIDS OF THE SECOND TYPE COMPRISED BETWEEN THESE TWO WILL INTERSECT THE POINSOT ELLIPSOID ALONG THE POLHODES AS SHOWN IN THE RIGHT-HAND FIGURE.





NOTE THAT THE ELLIPSOID OF THE SECOND TYPE WHICH HAS THE SAME INTERMEDIATE AXIS AS THE POINSOT ELLIPSOID INTERSECTS THAT ELLIPSOID ALONG TWO ELLIPSES WHOSE PLANES CONTAIN THE $y$ AXIS. THESE CURVES ARE NOT POLHODES, SINCE THE TIP OF $\underline{\omega}$ WILL NOT DESCRIBE THEM, BUT THEY SEPARATE THE POLHODES INTO FOUR GROUPS: TWO GROUPS LOOP AROUND THE MINOR AXIS ($x$ AXIS) AND THE OTHER TWO AROUND THE MAJOR AXIS ($z$ AXIS).

($c$) IF THE BODY IS SET TO SPIN ABOUT ONE OF THE PRINCIPAL AXES, THE POINSOT ELLIPSOID WILL REMAIN IN CONTACT WITH THE INVARIABLE PLANE AT THE SAME POINT (ON THE $x$, $y$, OR $z$ AXIS); THE ROTATION IS STEADY. IN ANY OTHER CASE, THE POINT OF CONTACT WILL BE LOCATED ON ONE OF THE POLHODES AND THE TIP OF $\underline{\omega}$ WILL START DESCRIBING THAT POLHODE, WHILE THE POINSOT ELLIPSOID ROLLS ON THE INVARIABLE PLANE.

A ROTATION ABOUT THE <u>MINOR</u> OR THE <u>MAJOR</u> AXIS ($x$ OR $z$ AXIS) IS <u>STABLE</u>: IF THAT MOTION IS DISTURBED, THE TIP OF $\underline{\omega}$ WILL MOVE TO A VERY SMALL POLHODE SURROUNDING THAT AXIS AND STAY CLOSE TO ITS ORIGINAL POSITION.

ON THE OTHER HAND, A ROTATION ABOUT THE <u>INTERMEDIATE</u> AXIS ($z$ AXIS) IS <u>UNSTABLE</u>: IF THAT MOTION IS DISTURBED, THE TIP OF $\underline{\omega}$ WILL MOVE TO ONE OF THE POLHODES LOCATED NEAR THAT AXIS AND START DESCRIBING IT, DEPARTING COMPLETELY FROM ITS ORIGINAL POSITION.AND CAUSING THE BODY TO TUMBLE.

GIVEN:
GYROCOMPASS CONSISTING OF ROTOR SPINNING AT RATE $\dot\psi$ ABOUT AXIS MOUNTED IN GIMBAL ROTATING FREELY ABOUT VERTICAL AB.
$\theta$ = ANGLE FORMED BY AXIS OF ROTOR AND MERIDIAN NS.
$\lambda$ = LATITUDE = ANGLE FORMED BY NS AND LINE OC PARALLEL TO EARTH AXIS
$\underline{\omega}_e$ = ANG. VELOCITY OF EARTH ABOUT ITS AXIS.

SHOW THAT
(a) THE EQUATIONS OF MOTION OF THE GYROCOMPASS ARE

$$I'\ddot\theta + I\omega_z\omega_e\cos\lambda\sin\theta - I'\omega_e^2\cos^2\lambda\sin\theta\cos\theta = 0$$
$$I\dot\omega_z = 0$$

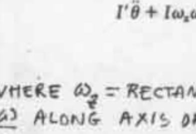
WHERE $\omega_z$ = RECTANGULAR COMPONENT OF TOTAL ANG. VELOCITY $\underline{\omega}$ ALONG AXIS OF ROTOR
(b) NEGLECTING TERMS IN $\omega_e^2$ AND FOR SMALL VALUES OF $\theta$,

$$\ddot\theta + \frac{I\omega_z\omega_e\cos\lambda}{I'}\theta = 0$$

AND THAT AXIS OF ROTOR OSCILLATES ABOUT THE LINE NS.

---

(a) ANGULAR MOMENTUM ABOUT O.



WE SELECT A FRAME OF REFERENCE $Oxyz$ ATTACHED TO THE GIMBAL.
THE ANG. VELOCITY OF $Oxyz$ WITH RESPECT TO A NEWTONIAN FRAME IS
$$\underline{\Omega} = \omega_e\underline{K} + \dot\theta\underline{j}$$
WHERE
$$\underline{K} = -\cos\lambda\sin\theta\,\underline{i} + \sin\lambda\,\underline{j} + \cos\lambda\cos\theta\,\underline{k}$$
THUS: $\underline{\Omega} = -\omega_e\cos\lambda\sin\theta\,\underline{i} + (\dot\theta + \omega_e\sin\lambda)\underline{j} + \omega_e\cos\lambda\cos\theta\,\underline{k}$ (1)

THE ANG. VELOCITY $\underline{\omega}$ OF THE ROTOR IS OBTAINED BY ADDING ITS SPIN $\dot\psi\underline{k}$ TO $\underline{\Omega}$. SETTING $\dot\psi + \omega_e\cos\lambda\cos\theta = \omega_z$, WE HAVE
$$\underline{\omega} = -\omega_e\cos\lambda\sin\theta\,\underline{i} + (\dot\theta + \omega_e\sin\lambda)\underline{j} + \omega_z\underline{k} \quad (2)$$
THE ANG. MOMENTUM $\underline{H}_O$ OF THE ROTOR IS
$$\underline{H}_O = I_x\omega_x\underline{i} + I_y\omega_y\underline{j} + I_z\omega_z\underline{k}$$
WHERE $I_x = I_y = I'$ AND $I_z = I$. RECALLING (2) WE WRITE
$$\underline{H}_O = -I'\omega_e\cos\lambda\sin\theta\,\underline{i} + I'(\dot\theta + \omega_e\sin\lambda)\underline{j} + I\omega_z\underline{k} \quad (3)$$

EQUATIONS OF MOTION
EQ. (18.28): $\Sigma\underline{M}_O = (\dot{\underline{H}}_O)_{Oxyz} + \underline{\Omega}\times\underline{H}_O$ OR, FROM (1) & (3):
$$\Sigma\underline{M}_O = -I'\omega_e\cos\lambda\cos\theta\,\dot\theta\,\underline{i} + I'\ddot\theta\underline{j} + I\dot\omega_z\underline{k} + \begin{vmatrix} \underline{i} & \underline{j} & \underline{k} \\ -\omega_e\cos\lambda\sin\theta & \dot\theta + \omega_e\sin\lambda & \omega_e\cos\lambda\cos\theta \\ -I'\omega_e\cos\lambda\sin\theta & I'(\dot\theta + \omega_e\sin\lambda) & I\omega_z \end{vmatrix} \quad (4)$$

WE OBSERVE THAT THE ROTOR IS FREE TO SPIN ABOUT THE $z$ AXIS AND FREE TO ROTATE ABOUT THE $y$ AXIS. THEREFORE THE $y$ AND $z$ COMPONENTS OF $\Sigma\underline{M}_O$ MUST BE ZERO. IT FOLLOWS THAT THE COEFFICIENTS OF $\underline{j}$ AND $\underline{k}$ IN THE R.H. MEMBER OF EQ. (4) MUST ALSO BE ZERO.

(CONTINUED)

## 18.158 continued

SETTING THE COEFF. OF $\underline{j}$ IN THE R.H. MEMBER OF EQ. (4) EQUAL TO ZERO:
$$I'\ddot\theta + (-I'\omega_e\cos\lambda\sin\theta)(\omega_e\cos\lambda\cos\theta) - (-\omega_e\cos\lambda\sin\theta)I\omega_z = 0$$
$$I'\ddot\theta + I\omega_z\omega_e\cos\lambda\sin\theta - I'\omega_e^2\cos^2\lambda\sin\theta\cos\theta = 0 \quad (5)$$
(Q.E.D.)

SETTING THE COEFF. OF $\underline{k}$ EQUAL TO ZERO:
$$I\dot\omega_z + (-\omega_e\cos\lambda\sin\theta)I'(\dot\theta + \omega_e\sin\lambda) - (-I'\omega_e\cos\lambda\sin\theta)(\dot\theta + \omega_e\sin\lambda) = 0$$
OBSERVING THAT THE LAST TWO TERMS CANCEL OUT, WE HAVE
$$I\dot\omega_z = 0 \qquad \text{(Q.E.D.)} \quad (6)$$

(b) IT FOLLOWS FROM EQ. (6) THAT
$$\omega_z = \text{CONSTANT} \quad (7)$$
REWRITE EQ. (5) AS FOLLOWS:
$$I'\ddot\theta + (I\omega_z - I'\omega_e\cos\lambda\cos\theta)\omega_e\cos\lambda\sin\theta = 0$$
IT IS EVIDENT THAT $\omega_z \ggg \omega_e$. WE CAN THEREFORE NEGLECT THE SECOND TERM IN THE PARENTHESIS AND WRITE
$$I'\ddot\theta + I\omega_z\omega_e\cos\lambda\sin\theta = 0$$
OR
$$\ddot\theta + \frac{I\omega_z\omega_e\cos\lambda}{I'}\sin\theta = 0 \quad (8)$$
WHERE THE COEFFICIENT OF $\sin\theta$ IS A CONSTANT. THE ROTOR, THEREFORE, OSCILLATES ABOUT THE LINE NS AS A SIMPLE PENDULUM.
FOR SMALL OSCILLATIONS, $\sin\theta \approx \theta$, AND EQ. (8) YIELDS
$$\ddot\theta + \frac{I\omega_z\omega_e\cos\lambda}{I'}\theta = 0 \qquad \text{(Q.E.D.)} \quad (9)$$

EQ. (9) IS THE EQUATION OF SIMPLE HARMONIC MOTION WITH PERIOD
$$\tau = 2\pi\sqrt{\frac{I'}{I\omega_z\omega_e\cos\lambda}} \quad (10)$$

SINCE ITS ROTOR OSCILLATES ABOUT THE LINE NS, THE GYROCOMPASS CAN BE USED TO DETERMINE THE DIRECTION OF THAT LINE. WE SHOULD NOTE, HOWEVER THAT FOR VALUES OF $\lambda$ CLOSE TO 90° OR −90°, THE PERIOD OF OSCILLATION BECOMES VERY LARGE AND THE LINE ABOUT WHICH THE ROTOR OSCILLATES CANNOT BE DETERMINED. THE GYROCOMPASS, THEREFORE, CANNOT BE USED IN THE POLAR REGIONS.

$$= (-0.5a\underline{i} + 1.2071a\underline{k}) \times (-F\Delta t_A)\underline{j} + (0.5a\underline{i} + 1.2071a\underline{k}) \times (-F\Delta t_B)\underline{j}$$

ANG. IMP. $= 1.2071\, aF(\Delta t_A + \Delta t_B)\underline{i} + 0.5aF(\Delta t_A - \Delta t_B)\underline{k} \qquad (2)$

IMPULSE-MOMENTUM PRINCIPLE
WE MUST HAVE $\underline{H}_G + \underline{\text{ANG. IMP.}} = 0$
OR, USING COMPONENTS:

$H_x + 1.2071aF(\Delta t_A + \Delta t_B) = 0 \qquad \Delta t_A + \Delta t_B = -\dfrac{H_x}{1.2071aF}$

$H_z + 0.5aF(\Delta t_A - \Delta t_B) = 0 \qquad \Delta t_A - \Delta t_B = -\dfrac{H_z}{0.5aF}$

SOLVING THESE EQUATIONS SIMULTANEOUSLY:

$$\Delta t_A = -\frac{H_z + 0.41421 H_x}{aF}, \quad \Delta t_B = \frac{H_z - 0.41421 H_x}{aF} \qquad (3)$$

IF $\Delta t_A > 0$, ASSUMPTION IS CORRECT, A SHOULD BE USED;
IF $\Delta t_A < 0$, ASSUMPTION IS WRONG; C SHOULD BE USED AND ACTIVATED FOR $\Delta t_C = |\Delta t_A|$.
SIMILARLY, IF $\Delta t_B > 0$, B SHOULD BE USED, AND IF $\Delta t_B < 0$ D SHOULD BE USED WITH $\Delta t_D = |\Delta t_B|$.

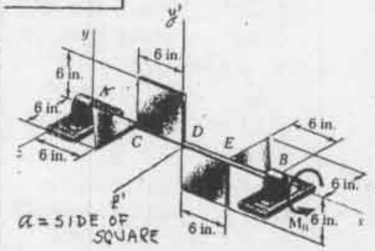
## 18.C3



$a$ = SIDE OF SQUARE

GIVEN:
A COUPLE $\underline{M}_0 = (0.03 \text{ lb}\cdot\text{ft})\underline{i}$ IS APPLIED AT $t = 0$ TO 2.7-lb ASSEMBLY OF SHEET ALUMINUM OF UNIFORM THICKNESS

FIND:
(a) COMPONENTS ALONG THE ROTATING y AND z AXES OF THE DYNAMIC REACTIONS AT A AND B FROM $t = 0$ TO $t = 2$ s AT 0.1 s INTERVALS,
(b) THE TIME (WITH 3 SIGNIFICANT FIGURES) AT WHICH THE z COMPONENTS OF THESE REACTIONS ARE EQUAL TO ZERO.

ANALYSIS

WE COMPUTE THE MOMENT AND PRODUCTS OF INERTIA OF THE ASSEMBLY WITH RESPECT TO THE CENTROIDAL AXES $Dxy'z'$. WE FIRST COMPUTE THE MOMENT AND PRODUCTS OF AREAS
FOR EACH SQUARE: $(I_x)_{AREA} = \frac{1}{3}a^4$, $(I_{xy'})_{AREA} = -\frac{1}{4}a^4$, $(I_{xz'})_{AREA} = 0$
FOR EACH TRIANGLE: $(I_x)_{AREA} = \frac{1}{12}a^4$, $(I_{xy'})_{AREA} = 0$

$(I_{xz'})_{AREA} = \frac{1}{2}a^2\bar{x}'\bar{z}' + \bar{I}_{x''z''} = -\frac{1}{2}a^2(\frac{4}{3}a)(\frac{1}{3}a) + \frac{1}{72}a^4 = -\frac{15}{72}a^4$ [CF. SP 9.6]

FOR ENTIRE ASSEMBLY:

$$(I_x)_{AREA} = 2(\tfrac{1}{3}a^4) + 2(\tfrac{1}{12}a^4) = \tfrac{5}{6}a^4$$

$(I_{xy'})_{AREA} = 2(-\frac{1}{4}a^4) = -\frac{1}{2}a^4 \qquad (I_{xz'})_{AREA} = 2(-\frac{15}{72}a^4) = -\frac{15}{36}a^4$

THE MASS MOMENT AND PRODUCTS OF INERTIA ARE OBTAINED BY MULTIPLYING THESE EXPRESSIONS BY THE MASS $m$ OF THE ASSEMBLY AND DIVIDING BY ITS AREA, WHICH IS EQUAL TO $3a^2$:

$$I_x = \frac{5}{18}ma^2, \quad I_{xy'} = -\frac{1}{6}ma^2; \quad I_{xz'} = -\frac{5}{36}ma^2 \qquad (1)$$

WE DETERMINE $\underline{H}_D$ AND ITS DERIVATIVE $\dot{\underline{H}}_D$

SETTING $\omega_x = \omega$, $\omega_y = \omega_z = 0$ IN EQS. (18.7), WE HAVE

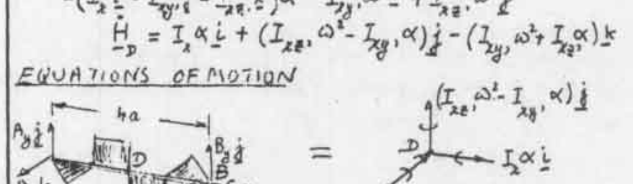
$$H_x = I_x\omega, \quad H_y = -I_{xy'}\omega, \quad H_z = -I_{xz'}\omega$$

$$\underline{H}_D = (I_x\underline{i} - I_{xy'}\underline{j} - I_{xz'}\underline{k})\omega$$

EQ (18.22): $\dot{\underline{H}}_D = (\dot{\underline{H}}_D)_{Dxy'z'} + \underline{\Omega} \times \underline{H}_D$

$$\dot{\underline{H}}_D = (I_x\underline{i} - I_{xy'}\underline{j} - I_{xz'}\underline{k})\dot{\omega} + \omega\underline{i} \times (I_x\underline{i} - I_{xy'}\underline{j} - I_{xz'}\underline{k})\omega$$
$$= (I_x\underline{i} - I_{xy'}\underline{j} - I_{xz'}\underline{k})\alpha - I_{xy'}\omega^2\underline{k} + I_{xz'}\omega^2\underline{j}$$
$$\dot{\underline{H}}_D = I_x\alpha\underline{i} + (I_{xz'}\omega^2 - I_{xy'}\alpha)\underline{j} - (I_{xy'}\omega^2 + I_{xz'}\alpha)\underline{k}$$

EQUATIONS OF MOTION



$$\Sigma\underline{M}_B = \Sigma(\underline{M}_B)_{eff}:$$
$$M_0\underline{i} - 4a\underline{i} \times (A_y\underline{j} + A_z\underline{k}) = \dot{\underline{H}}_D$$
$$M_0\underline{i} - 4aA_y\underline{k} + 4aA_z\underline{j} = I_x\alpha\underline{i} + (I_{xz'}\omega^2 - I_{xy'}\alpha)\underline{j} - (I_{xy'}\omega^2 + I_{xz'}\alpha)\underline{k}$$

EQUATING THE COEFF. OF THE UNIT VECTORS:

(i) $M_0 = I_x\alpha \qquad \alpha = M_0/I_x \qquad (2)$
FROM WHICH WE OBTAIN $\omega = \alpha t \qquad (3)$
(j) $A_z = (I_{xz'}\omega^2 - I_{xy'}\alpha)/4a \qquad (4)$
(k) $A_y = (I_{xy'}\omega^2 + I_{xz'}\alpha)/4a \qquad (5)$

$\Sigma\underline{F} = \Sigma(\underline{F})_{eff} = 0: \quad \underline{A} + \underline{B} = 0$

THUS: $B_y = -A_y \qquad B_z = -A_z \qquad (6)$

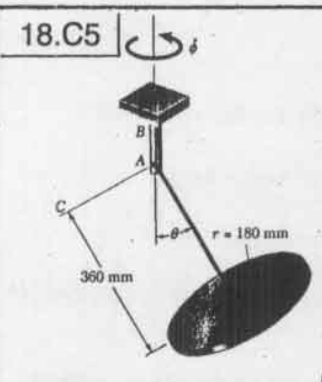
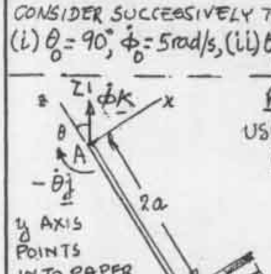
## 18.C5



GIVEN:
DISK WELDED TO ROD AG OF NEGLIGIBLE MASS CONNECTED BY CLEVIS TO SHAFT AB. ROD AND DISK FREE TO ROTATE ABOUT AC; SHAFT AB FREE TO ROTATE ABOUT VERTICAL AXIS. INITIALLY, $\theta = \theta_0$, $\dot\theta = 0$, $\dot\phi = \dot\phi_0$

FIND:
(a) MINIMUM VALUE $\theta_m$ OF $\theta$ DURING ENSUING MOTION AND TIME REQUIRED FOR $\theta$ TO RETURN TO $\theta_0$ (PERIOD).
(b) ANG. VEL. $\dot\phi$ FOR VALUES OF $\theta$ FROM $\theta_0$ TO $\theta_m$ USING 2° INCREMENTS
CONSIDER SUCCESSIVELY THE INITIAL CONDITIONS
(i) $\theta_0 = 90°$, $\dot\phi_0 = 5\,\text{rad/s}$, (ii) $\theta_0 = 90°$, $\dot\phi_0 = 10\,\text{rad/s}$, (iii) $\theta_0 = 60°$, $\dot\phi_0 = 5\,\text{rad/s}$.



ANALYSIS

USING THE ROTATING FRAME Axyz:

$$\underline{\omega} = \dot\phi \sin\theta\, \underline{i} - \dot\theta\, \underline{j} + \dot\phi \cos\theta\, \underline{k}$$

$$H_x = I_x \omega_x = I' \dot\phi \sin\theta$$

$$H_z = I_z \omega_z = I\, \dot\phi \cos\theta$$

WHERE $I = \frac{1}{2} m a^2$ (1)

$I' = \frac{1}{4} m a^2 + m(2a)^2 = \frac{17}{4} m a^2$ (2)

CONSERVATION OF ANG. MOM. ABOUT Z

SINCE THE FORCES CONSIST OF REACTION AT A AND WEIGHT $\underline{W} = -mg\underline{K}$ AT G, WE HAVE $\Sigma M_Z = 0$ AND $H_Z$ = CONSTANT
SINCE $H_Z = H_x \sin\theta + H_z \cos\theta = I' \dot\phi \sin^2\theta + I \dot\phi \cos^2\theta$,
WE HAVE

$$(I' \sin^2\theta + I \cos^2\theta)\dot\phi = (I' \sin^2\theta_0 + I \cos^2\theta_0)\dot\phi_0$$

SETTING $Q = I' \sin^2\theta + I \cos^2\theta$ (3)

AND $Q_0 = I' \sin^2\theta_0 + I \cos^2\theta_0$ (4)

AND SOLVING FOR $\dot\phi$: $\dot\phi = (Q_0/Q)\dot\phi_0$ (5)

CONSERVATION OF ENERGY

$T + V = E$ = CONSTANT: $\frac{1}{2}(I_x \omega_x^2 + I_y \omega_y^2 + I_z \omega_z^2) + W(-2a\cos\theta) = E$

$$\tfrac{1}{2}(I' \dot\phi^2 \sin^2\theta + I' \dot\theta^2 + I \dot\phi^2 \cos^2\theta) - 2mga\cos\theta = E$$

$$(I' \sin^2\theta + I \cos^2\theta)\dot\phi^2 + I'\dot\theta^2 - 4mga\cos\theta = 2E$$

RECALLING (3) AND SUBSTITUTING FOR $\dot\phi$ FROM (5):

$$(Q_0^2 \dot\phi_0^2 / Q) + I'\dot\theta^2 - 4mga\cos\theta = 2E \quad (6)$$

SOLVING FOR $\dot\theta^2$:

$$\dot\theta^2 = \frac{1}{I'}\left(2E + 4mga\cos\theta - \frac{Q_0^2 \dot\phi_0^2}{Q}\right)$$

WHICH IS OF THE FORM $\dot\theta^2 = f(\theta)$ (7)

WHERE $f(\theta) = \frac{1}{I'}\left(2E + 4mga\cos\theta - \frac{Q_0^2 \dot\phi_0^2}{Q}\right)$ (8)

AND Q IS THE FUNCTION OF $\theta$ DEFINED IN (3). THE CONSTANT 2E IS OBTAINED BY MAKING $\theta = \theta_0$, $\dot\theta = 0$ AND $Q = Q_0$ IN EQ. (6): $E = \frac{1}{2} Q_0 \dot\phi_0^2 - 2mga\cos\theta_0$ (9)

FROM (7) WE WRITE

$$\frac{d\theta}{dt} = \dot\theta = \sqrt{f(\theta)} \qquad t = \int_{\theta_0}^{\theta} \frac{d\theta}{\sqrt{f(\theta)}} \quad (10)$$

(a) THE TIME $\frac{1}{2}\tau$ NEEDED FOR $\theta$ TO DECREASE TO $\theta_m$ IS OBTAINED THROUGH NUMERICAL INTEGRATION, $\theta_m$ BEING DEFINED BY THE FACT THAT $f(\theta_m) = 0$ ($f$ CHANGES SIGN)
(b) FOR EACH DESIRED VALUE OF $\theta$, COMPUTE Q FROM EQ. (3) AND $\dot\phi$ FROM EQ. (5).

OUTLINE OF PROGRAM

ENTER $a = 0.18\,m$, $g = 9.81\,m/s^2$. ASSUME $m = 1$.
ENTER INITIAL CONDITIONS: $\theta_0$ AND $\dot\phi_0$
ENTER DECREMENT $d\theta$ YOU WISH TO USE
COMPUTE I AND I' FROM (1) AND (2)
COMPUTE $Q_0$ FROM (4) AND E FROM (9)
FOR $\theta = \theta_0$ TO $\theta = \theta_m$ (WHEN $f(\theta)$ CHANGES SIGN), AND USING DECREMENTS $d\theta$:
COMPUTE Q FROM (3)
COMPUTE $f(\theta)$ FROM (8)
CARRY OUT NUMERICALLY THE INTEGRATION INDICATED IN (10)
AT 2° INTERVALS, COMPUTE $\dot\phi$ FROM (5) AND PRINT THE VALUES OF $\theta$ AND $\dot\phi$

THE PERIOD OF THE OSCILLATION IN $\theta$ IS OBTAINED BY DOUBLING THE VALUE OF $t$ WHEN $\theta$ REACHES ITS MINIMUM VALUE $\theta_m$.

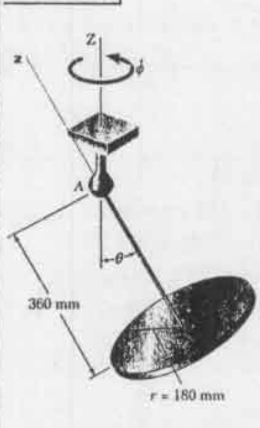
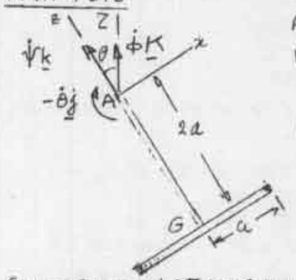
## 18.C6



GIVEN:
DISK WELDED TO ROD AG OF NEGLIGIBLE MASS SUPPORTED BY BALL AND SOCKET AT A.
INITIALLY, $\theta = \theta_0$, $\dot\theta = 0$, $\dot\psi = \dot\psi_0$, AND $\dot\phi = \dot\phi_0$.

FIND:
(a) MINIMUM VALUE $\theta_m$ OF $\theta$ IN ENSUING MOTION AND PERIOD (TIME REQUIRED FOR $\theta$ TO RETURN TO $\theta_0$).
(b) $\dot\psi$ AND $\dot\phi$ FOR VALUES OF $\theta$ FROM $\theta_0$ TO $\theta_m$ USING 2° INCREMENTS.
CONSIDER SUCCESSIVELY THE INITIAL CONDITIONS
(i) $\theta_0 = 90°$, $\dot\psi_0 = 50$ rad/s, $\dot\phi_0 = 0$
(ii) $\theta_0 = 90°$, $\dot\psi_0 = 0$, $\dot\phi_0 = 5$ rad/s
(iii) $\theta_0 = 90°$, $\dot\psi_0 = 50$ rad/s, $\dot\phi_0 = 5$ rad/s
(iv) $\theta_0 = 90°$, $\dot\psi_0 = 10$ rad/s, $\dot\phi_0 = 5$ rad/s
(v) $\theta_0 = 60°$, $\dot\psi_0 = 0$, $\dot\phi_0 = 5$ rad/s
(vi) $\theta_0 = 60°$, $\dot\psi_0 = 50$ rad/s, $\dot\phi_0 = 5$ rad/s

ANALYSIS



USING THE ROTATING FRAME Axyz WITH y AXIS POINTING INTO THE PAPER:

$\underline{\omega} = \dot\phi \sin\theta\,\underline{i} - \dot\theta\,\underline{j} + (\dot\psi + \dot\phi\cos\theta)\,\underline{k}$

$\underline{H}_A = I_x\omega_x\underline{i} + I_y\omega_y\underline{j} + I_z\omega_z\underline{k}$

$= I'\dot\phi\sin\theta\,\underline{i} - I'\dot\theta\,\underline{j} + I(\dot\psi + \dot\phi\cos\theta)\,\underline{k}$

WHERE $I = \frac{1}{2}ma^2$ (1)

$I' = \frac{1}{4}ma^2 + m(2a)^2 = \frac{17}{4}ma^2$ (2)

CONSERVATION OF ANGULAR MOMENTUM

SINCE THE ONLY EXTERNAL FORCES ARE THE REACTION AT A AND THE WEIGHT $\underline{W} = -mg\underline{K}$ AT G, WE HAVE $\Sigma M_Z = 0$ AND $\Sigma M_z = 0$. SINCE Z IS PART OF A NEWTONIAN FRAME OF REFERENCE, IT FOLLOWS THAT $H_Z$ = CONSTANT. BECAUSE OF THE AXISYMMETRY OF THE DISK, IT ALSO FOLLOWS THAT $H_z$ = CONSTANT (SEE PROB. 18.139). WE WRITE

$H_z$ = CONST: $I(\dot\psi + \dot\phi\cos\theta) = \beta$ (3)

WHERE FROM INIT. COND.: $\beta = I(\dot\psi_0 + \dot\phi_0\cos\theta_0)$ (4)

$H_Z$ = CONST.: $H_x\sin\theta + H_z\cos\theta = \alpha$

$I'\dot\phi\sin^2\theta + I(\dot\psi + \dot\phi\cos\theta)\cos\theta = \alpha$

RECALLING (3) WE HAVE $I'\dot\phi\sin^2\theta + \beta\cos\theta = \alpha$ (5)

FROM INITIAL CONDITIONS: $\alpha = I'\dot\phi_0\sin^2\theta_0 + \beta\cos\theta_0$ (6)

SOLVING (5) FOR $\dot\phi$: $\dot\phi = \dfrac{\alpha - \beta\cos\theta}{I'\sin^2\theta}$ (7)

CONSERVATION OF ENERGY

$T = \frac{1}{2}(I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2)$

$= \frac{1}{2}[I'\dot\phi^2\sin^2\theta + I'\dot\theta^2 + I(\dot\psi + \dot\phi\cos\theta)^2]$

SUBSTITUTE FOR ( ) FROM (3):

$T = \frac{1}{2}(I'\dot\phi^2\sin^2\theta + I'\dot\theta^2 + \frac{\beta^2}{I})$ $V = -mg(2a)\cos\theta$

$T + V = E$: $\frac{1}{2}(I'\dot\phi^2\sin^2\theta + I'\dot\theta^2 + \frac{\beta^2}{I}) - 2mga\cos\theta = E$ (8)

FROM INIT COND.: $E = \frac{1}{2}(I'\dot\phi_0^2\sin^2\theta_0 + \frac{\beta^2}{I}) - 2mga\cos\theta_0$ (9)

SOLVING (8) FOR $\dot\theta^2$: $\dot\theta^2 = f(\theta)$ (10)

WHERE

$f(\theta) = \frac{1}{I'}(2E - \frac{\beta^2}{I} + 4mga\cos\theta) - \dot\phi^2\sin^2\theta$ (11)

(CONTINUED)

SUBSTITUTING FOR $\phi$ FROM (7) INTO (11), WE HAVE

$$f(\theta) = \frac{1}{I'}\left(2E - \frac{\beta^2}{I} + 4mga\cos\theta\right) - \left(\frac{\alpha - \beta\cos\theta}{I'\sin\theta}\right)^2 \qquad (12)$$

FROM EQ. (10) WE WRITE

$$\frac{d\theta}{dt} = \dot\theta = \sqrt{f(\theta)} \qquad t = \int_{\theta_0}^{\theta}\frac{d\theta}{\sqrt{f(\theta)}} \qquad (13)$$

(a) THE TIME $\frac{1}{2}\tau$ NEEDED FOR $\theta$ TO DECREASE TO $\theta_m$ IS OBTAINED THROUGH NUMERICAL INTEGRATION, $\theta_m$, BEING DEFINED BY THE FACT THAT $f(\theta_m) = 0$, THAT IS, THAT $f(\theta)$ CHANGES SIGN FOR $\theta = \theta_m$

(b) FOR EACH DESIRED VALUE OF $\theta$, COMPUTE $\dot\phi$ FROM EQ. (7).

OUTLINE OF PROGRAM

ENTER $a = 0.12$ m, $g = 9.81$ m/s². ASSUME $m = 1$.
ENTER INITIAL CONDITIONS: $\theta_0$, $\dot\psi_0$, AND $\dot\phi_0$.
ENTER DECREMENT $d\theta$ YOU WISH TO USE
COMPUTE $I$ AND $I'$ FROM (1) AND (2)
COMPUTE $\beta$ FROM (4), $\alpha$ FROM (6), AND $E$ FROM (9)
FOR $\theta = \theta_0$ TO $\theta = \theta_m$ (WHEN $f(\theta)$ CHANGES SIGN), AND USING DECREMENTS $d\theta$:
- COMPUTE $\dot\phi$ FROM (7)
- COMPUTE $f(\theta)$ FROM (11)
- CARRY OUT NUMERICALLY THE INTEGRATION DEFINED IN EQ. (13)
- AT 2° INTERVALS, PRINT THE VALUES OF $\theta$, $\dot\phi$, AND, FROM (3), OF $\dot\psi = \frac{\beta}{I} - \dot\phi\cos\theta$

THE PERIOD OF THE OSCILLATION IN $\theta$ IS OBTAINED BY DOUBLING THE VALUE OF $t$ CORRESPONDING TO $\theta = \theta_m$.

FROM PROB. 19.113

$$x_m = \frac{r(m/M)(\omega_f/\omega_n)^2}{1-(\omega_n/\omega_f)^2}$$

RESONANCE AT 400 rpm MEANS THAT $\omega_n = 400$ rpm

$r(m/M) = (4\ \text{in.})(2/16)/(220) = 2.2727\times10^{-3}$ in.

(a) $(\omega_f/\omega_n)^2 = (800/400)^2 = 4$

$$x_m = \frac{2.2727\times10^{-3}\ \text{in.}(4)}{1-4} = -0.00303\ \text{in.}$$

AFTER THE PLATE IS ADDED THE NATURAL FREQUENCY OF THE SYSTEM CHANGES SINCE THE MASS CHANGES $\omega_n'^2 = k/M'$

SINCE THE VIBRATION IS TO BE LESS THAN $60\times10^{-6}$ m FOR MOTOR SPEEDS ABOVE 300 rpm, WE HAVE

$$x_m = -60\times10^{-6}\ \text{m} = \frac{(28.542\times10^{-9}\ \text{m}\cdot\text{s}^2)(300\cdot\frac{2\pi}{60}\text{s}^{-1})^2}{1-\left(\frac{300\cdot2\pi/60}{\omega_n'}\right)^2}$$

$$-2.1299 + 2.1299\left(\frac{986.96}{\omega_n'^2}\right) = 1$$

$$\omega_n'^2 = \frac{2.1299(986.96)}{3.1299} = 671.6\ \text{s}^{-2} = \frac{k}{M'}$$

$M' = (147.15\times10^3\ \text{N/m})/(671.6\ \text{s}^{-2}) = 219.1$ kg

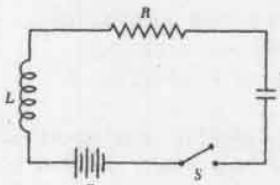
R, L, C CIRCUIT AS SHOWN WITH SUDDENLY APPLIED VOLTAGE E WHEN THE SWITCH IS CLOSED



FIND:

VALUES OF R FOR WHICH OSCILLATIONS WILL TAKE PLACE WHEN THE SWITCH S IS CLOSED

FOR A MECHANICAL SYSTEM OSCILLATIONS TAKE PLACE IF $c < c_c$. (LIGHTLY DAMPED)
BUT FROM EQ. (19.41),

$$c_c = 2m\sqrt{k/m} = 2\sqrt{km}$$

THEREFORE

$$c < 2\sqrt{km} \qquad (1)$$

FROM TABLE 19.2:

$$c \to R$$
$$m \to L$$
$$k \to 1/C \qquad (2)$$

SUBSTITUTING IN (1) THE ANALOGOUS ELECTRICAL VALUES IN (2), WE FIND THAT OSCILLATIONS WILL TAKE PLACE IF,

$$R < 2\sqrt{(1/C)(L)}$$

$$R < 2\sqrt{L/C}$$
